Now that we have Peace, what are we going to do with it?

To the Manufacturer:

After the joys and celebrations of peace are forgotten, there remains the stern and difficult task of restoring your factory to a peace basis. Whether the factory has been making hand grenades or pianos, the war has imposed certain restrictions which alter former conditions; and with the advent of peace, new conditions are met. In some cases increased facilities, due to munition work, call for new products to take the place of the abandoned military ones. In others, the old-time products of former peace days, have been worn threadbare, and new ones are necessary. What are you going to make?

To the Inventor:

Your opportunity is at hand. You are being sought today for your ideas. Those patents which were granted you several years ago, and which have lain dormant in the pigeon holes of your desk or in the strong box at home, may now find a ready market if they have reasonable merit. For the increased manufacturing facilities of many American industries, brought about by inflated military production, are now seeking for something to make—something which can keep the wheels turning. The ammunition of today is ideas; and the batteries of lathes, planers, automatic machinery and so on are standing by waiting for you.

TO the end of bringing the manufacturer in touch with the inventor, so that one may obtain the ideas which the other desires to dispose of, the SCIENTIFIC AMERICAN has established a Reconstruction Department. Under that heading will be published the requests of manufacturers for new ideas, stating their facilities and specific requirements, as well as the offerings of practical inventors. The department is to be a rialto for manufacturers and inventors. It is but another feature which goes to make the SCIENTIFIC AMERICAN "The Journal of Practical Information—and Practical Service."

The Coos County Forests

IN Coor County, Oregon, on the western ade of the Coast Range Mountains, through a primitive forest of fir and cedar the Lost River wends its way. In one of the most inaccessible parts which only the hardiest of "hikers" have penetrated the

"hikers" have penetrated the triver makes a drop of nearly 100 feet. The overhanging bank forms a deep case before which the water forms a gausy curtain. The diministrice spectators in the accompanying photographs give some idea of the height of the falls, and the aise of the height of the falls, and the aise of the height are viewed Lost River Falls have seen nature just as the maker designed it. As yet its suntouched by man

Lost River empites into the East Fork of the Coquille River This river also forms a cascade of rare beauty, the Cape Horn Falls Here grows the myrite tree, a very hardy tree, but one that cannot he transplanted It furnishes a lard beautifully grained, high-priced wood, used in making nut bowls The myrite tree, although plentiful on the west sude of the Coast Range is not to be found on the east side

A still lofter cascade is to be found in the Camas Creek, where there is a drop of 200 feet "Toe Head Falls," as it is called, is located in the recesses of an almost unknown for it. The photograph shows two timber crusers on the instirul foot log in the foreground. The foot log is formed by a fallen tree which holds in check a mass of flotting debris. In this

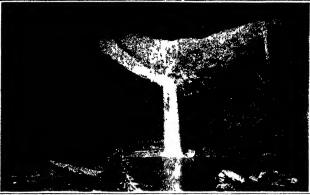

region beautiful forn fronds are to be found as tall as a man and taller

Despite the hardships of penetrating the primitive forests of Coos County, visitors will be amply repaid for their arduous efforts in the magnificent examples of

the inagnificent examples of Nature's handiwork which abound in these wild regions

Mt. Katmai Explorations

THE exploration of the Mt Katmai region, in Alaska, under the auspices of the National Geographic Society, which is likely to be of several years' duration, was carried forward last summer by Messrs J Sayre and P P Hagelbarger After a hazardous voyage, they arrived on June 10th at Naknek Lake, and they completed their season's work in August The topographic survey, begun in 1917, was extended to the shores of Bering Sea, adding about 1,500 square miles to the map and completing a sec-tion across the base of the Alaska Peninsula from Katmai Bay to Kaknek Lake Measurements of the temperature of volcanic vents were made with pyrometers supplied by the Carnegie Geophysical Laboratory, the highest temperature found being 430 deg ('ent

The abject of this poured is to record accurately and liveally the latest scientific, mechanical and industrial nears of the day. As a weekly journal, it is in a position to announce interesting direlepments before they are published class here.

The Latter is glad to have submitted to him timely articles suitable for these columns especially when such articles we accompanied by photographs

Harmony of the Peace Conference Threatened

E showed last week, that the end of the war finds the United States Navy in second position and equal in power to the three next navies combined. This very startling revelation must be borne in fund when considering any plans for future naval expansion.

During the ten years preceding the outbreak of the European war, Congress had been conservative to the point of parsimony in its annual appropriations for the unkeen and increase of the Navy The dangers of this policy were repeatedly pointed out in these columns, and when the war began, the SCIENTIFIC AMERICAN did what it could to explain the situation and make clear the absolute necessity of bringing the standing of our Navy back to second place. It is quite possible that neither Congress nor our people had appreciated the menace involved in Germany s naval program, which mereased with the passing years, even if the German plan of world conquest had been revealed in those days, no one would have believed that it was anything more than an empty dream But whatever lay back of German naval activity the fact that our fleet was falling so far behind the German fleet in fighting strength, filled all careful students of the naval situation with deep concern

In 1916 a vast program of now construction was mapped out and passed by Cougross, and although the ships of that program have not been built, owng to other and more imperative naval work demanded by the exigencies of the war it was an excellent provision and it would have brought us back to the second place. It still remains on our books as as authorized program to be extreded.

But the astounding proposition is now made by the Secretary of the Navy, not only that this program should be completed, but that an additional program, equal in extent, should be approved by Congress Those who are interested in naval affairs are confounded by such proposals being put forward at this time, and naturally sak the meaning of any such amazing increase of our navy

The explanation put forth by Secretary Daniels and Admiral Badger, that we need 32 new super-dreadnoughts to police the sens in time of peace, is so puerile that it is difficult to take it seriously Policing is done by gunboats and labt crusters, not by super-freadnoughts

Moreover, it is evident that the announcement of such an nonrmous program places the United States in a most inconsistent, if not ridiculous position. Our President has gone before the Allient and incoming the proposal for a Leegue of Nationa in the other, and words of peace upon his lips, nevertheless, while our President is thus advocating disarrament and the destruction of militarism, the Secretary of the Navy is calling for an enormous increase in the size of our navy with all the threat of militarism which that implies. The Secretary is in earnest, for he has made speeches advocating this plan on various occasions and in different parts of the country Meanwhile our Press is discussing the desarability of taking the magnificent German fleet which has been surrendered to the Allies, and sinking it on the high sees, as the samplest method of

disposing of what might become a cause of dissension among the Allies; atthough this assumption of existing jealously among the Allies is gratuitous, unwarranted, and in devidedly bad taste

We heatare to believe that Mr Daniels, who has always been an advocate of peace, has suddenly become a disciple of militarism; but can any other construction be placed on he action? The Secretary of the Navy is no doubt a good Democrat He as member of the Cabinet of the Democratic administration which for overhalf a century has advocated economy in governmental administration. Is Mr Daniels true to these principles when he brings forward, at this time, a naval program which will add many billions to the public debt?

This proposed fleet must be paid for by the people, and the Secretary calls upon every American estiment to meet has share of an expenditure which is as Vast as it is needless. It would seem that the heavy sums which have been handled in the course of the war have so blunted the many sense of some of our Government officials, that they have forpotten that it is the industrial tarpayers of the United States who must carry the burden and pay the price

Our President has very definitely announced that the advantages which the United States expects to gain from this war are of a purely moral and spiritual kind. Not the least of these is the sweeping away, once for all, of that long-discredited "whip-resiston" spirit, which Mr Daniels (unconsciously, of course) is fanning into flame by his advocacy of the biggest away one aerth.

The Factory and the Home

BUCYRUS, Ohio, manufacturer recently brought to that city, by a great effort, 150 employees, after a few days 30 remained, the blainec having decamped because they could find no comfortable homes A prominent public sorrier corporation near Philadelphia confesses to a labor turnover of 1,100 per cont, and while this is exceptional, a figure of 400 per cent is common

These conditions are widespread During the past two or three years employers of labor in all our big industrial centers have experienced such difficulty in getting and keeping men that much attention has been focused upon the employment situation. Investigation has shown that one of the prime causes for the shifting population and large turnover of many plants is the utterly inadequate housing accommodations available for the workers.

In years gone by, when wages were low and "labor turnover" meant nothing to the accountant of costs, there was always a long line of men waiting for a job; and because of this excess of supply over demand, a man was not so ready to throw up his job and look for another. If would put up with poor housing conditions for the sake of having any job at all. But tooks of the sake of having any job at all. But tooks there is no longer the economic pressure upon the worker that forces him to sleep six or eight in a room hardly big enough for two, and to turn out of bed in the morning just in time for the night-shift man to take his place. So as fast as manufacturers bid for his services by putting up decent houses, he is going to leave the old unsanitary crowded quarters and go to the new village where he can hiv decently with his wife and family.

The manufacturer will do well to bring himself to a realisation of the fact that labor, in thus exacting decent living accommodations, is not holding up the community or the employer for something that is not its just due. The laborer is rather in the position of one who has been unable to get what was due him, and who now for the first time is free of that disability. Naturally enough he makes hay while the sun shines, here as well as in the matter of wages, but while wages may go back to a lower level, it is not conceivable that it will ever again be good form to herd workers in the disgraceful manner in which they have been herded in the past

Indeed, apart from any consideration of this subject on the humanitarian or sentimental side, the industrial employer is beginning to realise the tromendous importance of good living conditions in their relation to production. Many years ago he discovered that it paid to give his workers decent surroundings while at their work, and now be a discovering with equal force that it pays to see that they have a place to live in which a normal human being can take some pleasure in living.

The manufacturer is finding out that men who are housed in unhygienic and unsanitary dwellings are not so healthy, not so efficient, lose more time through sickness, and are more stupid and more troublesome in this plant. Statistics compiled in Chicage and electrics show conclusively that the areas having maximum density of population coincide with those having the highest percentage of tuberculcois and other contagious diseases, as well as of crime and social evil. Indeed, it could not be otherwise.

The output of a plant is satiously affected by the prevalence of sickness. With open privise and cesspoole in every workman's backyard, and wells within 20 fact of these, typhoid is an ever present alonger. With overcrowding and lack of opportunity for personal cleanliness, tuberculosis and other diseases flourish. We know one estimable lady who supports hereelf is a manufacturing town by taking in lodgers, and who accounts herealf fortunate when, as is frequently the case, she secures a roomer who declares that he does not wish to use the bath tub. Her mistaken point of view is well matched with that held by many@mployers, but, happily, every day by less. We are affect coming to realise that people who hve in pig-stikes are likely to be and to act hist pigs. If we want respectable and in telligent men and women to work for us, we must see that they have deecent, healthy and comfortable homes.

It is for this reason that, more and more, employers are sesuming responsibility of some sort in connection with housing accommodations for their workers. This need not always take the form of company-owned cottages or apartments-s form that is often resented, even when coupled with a scheme for ultimate sale to the tenant. It has many weak points to offset its obviously strong ones, and makes the maximum demand for extreme judgment in administration; but in many instances it is the only satisfactory solution. Indeed, in the twentieth century reaction from the nineteenth century idea that every man's life was his own-as run and run as he pleased so long as he steered clear of actual crime, we are developing a race of people who deal so expertly in human relations that, after all, the dangers of paternalism and the probabilities of any system degenerating into peonage are minumised.

Without hesitation, we say that every large plant located outside the very biggest centers of population should choose between three alternatives. One of these is regulating housing conditions from without, by bringing pressure to hear upon owners and local authorities. The second is similar regulation brought about by actual participation in the business of housing. The third is submission to a high turnover and a low class of workers. For today, unless an employer sees to it that his employees have a respectable place to live in, he cannot get good mean or keep any kind of man

And finally, if the employer does not set his house in order of his own accord, it is up to us to make him do so; for our reconstruction program can be hampered by no factories that are running at half or quarter their rated capacity through ineffective labor conditions. Great Britain has spent \$700,000,000 on industrial housing since the war began; with our late estrance we have spent \$110,000,000, which is but a tithe of the capital that must oventually go into the improvement of our workers' home.

Fossils from the Canadian Rockies

LATE report on the explorations and field-work of the A LATE report on the saputation in 1917 records a remarkable collection of fossils made by Secretary and Mrs. Walcott at the now well-known "Burgess Pass fossil quarry," near Field, British Columbia, discovered in 1919. Ir the course of 50 days' work the party took out a section of the quarry about 180 feet square, thus practically exhausting a site that has yielded the finest and largest series of Middle Cambrian fossils yet dissovered, and the finest invertebrate fossils yet found in any formation More than a ton and a half of specimens were trimmed out at the quarry, wrapped in bundles, carried by pask horses to camp and thence to the railway stati Field, whence they were shipped to Washington. Large blocks of hard shale were first blasted loose, then carefully split with chisel and hammer to expose any fossil remains between the lamins. The shale has preserved for some twenty million years animals that were as soft and non-resistant as jellylish, worms, crass, etc., not-withstanding all the vicinstudes these rooks have since undergone from the time they were simply hardene mud. They have been subjected to much pressure and profound chemical change, but the fossile remain vierte

Review of the Year 1918 The World War

FifE closing months of the year now past witnessed the fall of the curtain upon the most stupendous of all the multiplied human tragedies which have moved across the stage of life since life began.

War, at any time, even when its wounds and sorrows are tempered by forbearance and chivalry, is a dreaded thing, the threat of which, when it lifes its head over the worge of the world, makes the cheek blanch and the routest heart quail. This is true, even when nations which are enriched with the gifts and graces of civilisation fight for causes which seem to each contestant to invalve the fundamentals of right and morality.

The horror and enormity of this war lie in the fact that it was an avowed strack upon Civilination itself that the assault was carried on with a cynical and calculated disregard of every consideration of chivalry and meroy—and that, if it had won out, all the world's cherished and hardly won ideals of Justice, Freedom and Honor would have been thrown down, and the God of Brute Force would have been set up in their place.

The cost to Germany and her allies of this monatrous raid upon the world was 3,350,000 dead and 12,070,000 casualties. The assault was met and mastored by the forces of Civiliation at a cost of 4,560,000 dead and 19,525,000 casualties. The casualties on all sides reached a total, therefore, of 31,595,000.

Increasingly, as the years roll by, the historians of the future will write it down that this stupendous conflict was fought out to make the world a safe place, not merely for Democracy, but for Civilisation itself.

Nevel

In any review of naval events during the past year, the outstanding fact is the crowning demonstration of the decisive value of the command of the sea. Mahan explained all that to us years ago. What a pity it is that he did not survive to witness the latest demonstration of the truth of the principles he laid down in his great work "Seapower in History," and take his stand with Admirals Beatty, Sims, and Rodman on the bridge of the "New York", to survey the surreader of the German fleet. Wars can be won by blockade as well as by battle. It was blockade that brought Germany to her knees, and, as a substitute for battles, it is an altogether merciful and humane provision for bringing an enemy to terms. Also, it is an effective means, in time of war, of making sure that the freedom of the seas shall be unobstructed in times of peace

Although the war is over, not much information is yet available as to the warships and new material which have been developed abroad. Capital ships continue to increase in size, speed, and gun-power. The British have built some battle-cruisers of about thirty-two thousand tons displacement, 33 knots speed, carrying the 15-inch gun in their main batteries, and with moderate armor protection. Also, they have brought out an entirely new type of ship in the "Furnous"; a sort of magnified destroyer, as long as the largest Atlantic liners, narrow, of shoal draft and heavily engined. The reputed speed is 40 knots and the reputed armament, as originally placed, was two 15-inch guns. Another novel type is the monitors, of which, we understand, some thirty have been built. They carry a pair of heavy 19- to 15-inch guns, in a single turret. The speed is very low indeed, and they were built mainly to attack the German bases on the Belgian coast. They are practically useless today. The British appear to be satisfied with the 15-inch gun for the main armament of their battleships; the United States will use the 50 calibre 16 inch gun in all future dreadnoughts, whether ther be battleships or battle-cruisers. The first four battleskips of the 1916 program and the six battlecruisers will mount this fine piece, which fires a 2,200-pound shell with a velocity of 2,800 feet per second.

The war hat served as a fresh demonstration of the efficiency of the United States Navy. It found the navy, as usual, "on its teen." The best of our destroyers were at space dispatched to the submarine some; 150 new destroyers, seems offered; guas were found for arraing dur miniphant ships, and shifted gun crows were sent-te man; 150mm; 150m, 150

of new and powerful scaplance was designed and put under construction; scaplance bases were established on the British and French coasts, and the personnel of the navy for manning our warships, transports and merchant ships was raised to 700,000 men. The close of the war finds our navy the second most powerful in the world, and equal in strength to that of the next three of the great naval powers combined

Military

Unquestionably, the most novel and most effective of the new weapons of warfare developed during the great conflict, was the tank. Its first operations in 1916, in the great British attack on the Somme, were necessarily tentative in character As the war progressed tank tactics developed in efficiency, and in the 1917 attack at Cambrai, it came into its own by making a 10-mile breach through the German system of ontrenchments-this being the first time that an absolute break-through was accomplished. The campaign of 1918 served to introduce the winppet or small "baby" tanks, and in the great counter-offensive operations of this year, both of the French and Bruish and Americans. the tank established itself as the most effective weapon of the offense; in fact, German inditary commanders openly attributed the success of the Albed offensives to the employment of the tank in large numbers

The war has demonstrated the enermous nulitary value of the machine-gun, especially as a weapon of defense But for two American inventions, the machinegun and the submarine, the German armies would have collapsed long before they did, and it is a fact, that by far the major part of the casualties of the war on land have been due to the heavy and light machine-guns As regards artillery, the most remarkable development has been the use of guns of the very heaviest caliber in mobile field operations. Before the war, the six-inch howitzer was considered to be the heaviest piece that could be used in the field. Austria and Germany surprised the world with their 12-inch and 16-inch semimobile howitzers, and at the oud of the war the heaviest and most powerful guns in existence, including the 21-inch gun of the French, were in the field and following up the retreat of the German armies Notable work in this direction was done by our army and navy, the navy having placed in the field several batteries of 14-inch naval guns mounted on specially-designed railway carriages, and also a certain number of our 16-inch guns. These were used to good effect in shelling important military roads and railway lines in the back areas of the enemy.

Field and heavy artillery cannot be built over night, but the Ordnance Department of the army had begun the construction of a vast amount of ordnance, in which was incorporated the ripe experience of our Allies during four years of war, and which included such improvements as had suggested themselves to our own expert artillerists. Had the war been extended into 1919, the Germans would have been subjected to an overwhelming weight of artillery fire from guns of our own design and manufacture.

A weapon which excited widespread interest at the time was the 75-mile gun, with which the Germans shelled Paris. There is nothing novel in the principles employed in the design of this gun Whatever may prove to be the details of its construction, it will be found to embody an unusually large powder chamber and an exceedingly long bore; the one to provide sufficient powder for a range of such great length, and the other to provide sufficient space or volume in which to de velop the expansive energy of the gas If any nation wished to do so, it would be perfectly feasible to build; gun with a range of 100 miles or over So far as we know, the Allies have not, as yet, come into possession of any of these guns, and the particulars are not yet available. It is certain, however, that the Germans either built an entirely new piece of 75 to 100 calibers length, or sub-calibered a standard 15- or 16-inch gun by inserting a liner.

Engineering

During a war which was essentially a war of machinery, it was inevitable that projects of peace-time engineering would suffer. The accomplishments of the engineer have been more in the like of thoughtful investigation and planning than of actual construction. The New York State Barge Canal is supposed to have been finished, but this great work has been so completely the football

of conscienceless politicians that it is difficult for the taxpayer to find out either just where his money has gone or what he has got for it. God send the day when public utilities will be taken entirely out of the hand of the politician and committed to the unbindered control of reputable and qualified non-political engineers than whom no wiser, more honorable and more able class of men is to be found in the country. Hydraulic and reclamation work is very much in the air just now, the government talks of vast schemes of reclamation, and of the placing of our returned soldiers on the virgin and fruitful soil Canada, with characteristic energy, has started upon a great enterprise for the development of 300.000 hydro-electric horse-power from the Ningara River, and she proposes to secure an effective head of 305 feet (instead of about one-half of that as in the case of power plants located at the Falls), by building her power plant at Queenston, below the rapids, where the river level is only two feet higher than the level of Jake Ontario

According to Dr. Waddell, the well-known consulting engineer, there is under serious consideration the construction of a combined ship, samitation, and power canal from Lake Eric to Lake Ontario. The total length would be 40 miles and the depth 30 feet. The total fall is 327 feet. The object would be to transfer the largest lake vessels and barges from Eric to Ontario, to divert the sewage of Lackawania, Buffalo, Tomawanda and other enters from Eric and the Niagara River, purify it and discharge the waters into Lake Ontario, and finally, to develop about 800,000 hydroelectric horse-power. The rassing and lowering of ships would be done by buge lift-locks capable of landling 650-foot ships through a vertical haight of 200 feet.

The Quebec bruke was tested out in August of last year by running out two heavily ladon freight trains, one on each track upon the central 1,800-foot span. The total load was 7,000 tons. The bruke stood the test successfully. In the field of transportation, the most notable piece of railroad construction was the completion last year of the 'desert' railroad, which forms the closing link in Australia a first trans-continental line. It took five years, working under a according beat, in a country davoid of water and vegetation, to close this 1,000-mile gap. It is now possible to make a continuous railroad journey from Perth, Western Australia, to Brabane, Ouendand, a distance of 3,905 miles.

Electricity

Although electricity is a peaceful force rather than a military one, it has thrived and forged ahead during the past year of war

The scarcity of coal in certain countries has given a trumendous impetus to bydro-electric developments, so that in Norway, for instance, hydro-electric power is now being employed to an unprecedented extent. And the generation of this cheap form of electric power has brought about the extensive application of electric current in industrial pursuits, particularly in the metallulgical field. Much has been done in establishing large aluminum producing plants and electric steel works. As a result of this inexpensive and abundant electric energy, the electro-chemical industries have benefitted in no small way.

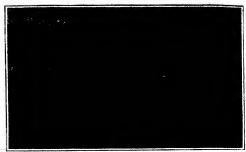

To the electric welding art, the past twelve months have contributed much. All kinds of applications have been found for this method of joining metals together interesting researches have been carried out with regard to the electric welding of ships, instead of the usual riveting process. As yet the electric welding of ships is still in the experimental stage, although it is acknowledged to have certain important advantages over the existing method, particularly in the matter of labor.

In the held of radio communication, the progress during the past year has been considerable. The radio telephone has been developed to a point of relative periotion, due to the use of the vacuum bulb generators in place of the former troublesome and uncertain are generators. With the lifting of the veil of censorship, we learned of the wireless telephone for communicating between airplanes and ground stations, making possible the greatest precision in air fleet maneuvers. Indeed, at the recent avation meet at Belmont Park, N. Y., the speciators were thrilled by the unison of movement of an entire feet of airplanes; and it was several weeks.

Where Nothing Goes to Waste

Glimpses of the United States Army's Salvage Photographs Copyright, Committee on Public Information

A SALVAGE plant for the recovery and proper use of waste material has been organized on a large scale by the Army near one of the large towns of France No army in the world has anything like it, and not a day names that representatives from some of the Allied

operation It has saved, not thousands, but milhous of dollars for our Government. We will mention the various kinds of work which are carried on in some of the departments of this vast salvage plant

For instance, the shoe department is one of the most important, and shoes and boots are brought in by thousands of pairs. They are first washed and disinfected, sorted, and then given out to be repaired, inspected and packed for shipment again The production in this branch is about 3,500 pairs per day The total value of the ontput for one month was \$149,599 About 80 per cent of all shoes received are repaired New machinery is being constantly added to this department, and when it is completely organized, it is expected that 7,000 pairs of shoes will be turned out daily. At the time of writing this branch employed two officers, seven non-commissioned officers, 114 enlisted men, 280 male and 249 female civilians

The depot has seven operating departments, hundry, clothing, shoes, rubber goods, harness and leather equipment, canvas and webbing, and metals The laundry alone employs 206 workers, over half of whom are civilians. All sorts of new devices in machinery are used, save hand labor for washing, rinsing and drying, and more than 75,000 pieces

are turned out per day. The clothing is probably the are innea out per day. The clothing is probably the most important department. Its production is limited almost entirely to breeches and blouses, underwear, bed sacks and blankets. The daily output is 10,000 woulden breeches or blouses, 25,000 of underwear or bed sacks and 500 blankets After coming from the laundry Governments do not inspect it and take notes on its

Working old hats over into new hats and bedroom slippers

the garments are examined and marked for repair, or if not reparable they are cut up for patches. The patches necessary for the reparable garments are cut entirely from the irreparable ones (15 per cent of the total), and then sent out to the various branches for the actual sewing, after which they are classified either for reissue to the troops in active service or for depot troops or labor battroops in active service or for depot troops or labor ost-talions. About 1,600 women are employed in this branch, and 75 men. The value of the production for a month was \$2,040,831, while the operating costs came to the relatively insignificant total of \$83,432.

Not a scrap of anything is wasted. Hospital slippers are made from old campaign hats that have been dis-carded The question has often been asked as to what became of these hats. fact they are of an excellent quality of felt, and no matter how old and worn they are, the felt is utilized in the soles of the slippers. The uppers are made from old woollen garments thrown aside as quite irreparable Overseas caps are another specialty made from old uniforms unfit for repair, and brassards are manufactured by the thousands for the various army services. Old garments are dyed green and marked "P W." to be used by the German prisoners of war. The old trench shoes that have already been mended and are now beyond repair, are cut up into shoestrings No matter how worn the shoes are, there is always a piece of leather left in the uppers large enough to make several pairs of strings.

The rubber goods branch also shows remarkable figures for saving. It handles primarily rubber boots and arctics, "slickers," pouchos and shelter halves, it produces about 3,000 garments and 850 pairs of boots per day. The great feature of the de-partment is the new vulcanizing machine recently put into

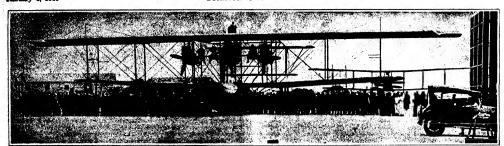

(Constnued on page 18)

Our Giant Aircraft

Where We Stand in the Matter of Transatlantic Flight

THINGS move swiftly in the flying world. It seems but yesterday that we were awed at the size and power of the "America"—the flying boat built by Glenn H. Curtiss for Rodman Wanamaker, who was backing Lieut. John Cyril Porte, R.N., in his attempt to win the \$50,000 prise offered by the London Daily Mail for the first transatlastic flight. Today there are

hundreds of airplanes as large or larger than the" America" in fact, flying boats of that general type have been in quantity production for some time past at our Naval Aircraft Factory. So the marvel of yesterday has become the commonplace of the present; which is another way of saying that this is the day of giant aircraft.

Prior to the great war, the efforts of all aeronautic constructors, with the exception Russian engi Sikorsky, were confined to relatively small planes. From military point of view. there was no need for huge airplanes; and, indeed, the smaller the type the more it appeared to be suited to war's requirements. During the war, however, the bel-

ligerents soon came to appreciate the military value of aerial bombing, and soon set to work on fleets of bombing planes. Germany, in order to bomb English towns, constructed her Gothas and Friedrichshafens after the failure of her Zeppelins; Italy constructed her Caproni biplanes and triplanes for bombing Austrian military centers on the other side of the Alps and far in enemy

territory; Great Britain con-structed her Handley-Pages for the purpose of repaying the Germans in their own coin. France, on the other hand, did not take to longdistance bombardment, probably because of her geo-graphical location which ade her an easy target for German bombing fleets. bomb the Germans, according to the French viewpoint, only served to provoke their only served to provoke their bombing fleets to greater efforts. Finally, the United States set to work building huge planes of the Handley-Page and Caprent types for tong-distance bombing. Another-feature of the war

which gave impetus to the big plans movement was the submarine warfare. When of aircraft in auti-operations became t, the Allied savies set to work developing scaplanes and flying boats capable of making long flights and carrying suitable armament, including depth bombs. Then it was that Great Britain went back to the "America" type of flying boat, and started with that huge type as a foundation. Today the British and American navies foundation. Today the British and American navies have large fleets of flying boats of the same general

category of the largest heavier-than-air craft in existence, Several weeks past, this flying boat, officially known as the N. C. 1, made a flight off Rockaway, N. Y., carrying 50 passengers with ease. Its lifting capacity is said to be five tons.

The N. C. 1 is depicted in the accompanying illustra-

tions, which serve to give a good idea of its magnitude

and general design. It is and general design. It is equipped with three 12-cylinder Liberty engines, driving three four-bladed tractor serows. The wing spread is 120 feet. From prow to tail she is 70 feet long, and from the gunner's cockpit on the top wing to the keel is a distance of 25 feet. The distance between the upper and the lower planes is 12 feet, which also happens to be the depth or chord of the planes.

The scating arrangement is quite odd. In the center of the top wing is the observergunner's post, with nothing to interfere with his view and his shooting. pilot's quarters, provided with two seats and two sets of controls, are located in a nacelle between the planes.

Below the lower plane, seats for four are fixed, and below that the boat part of the plane has a capacity for a number of observers or passengers. As equipped for coast-guard duty, the plane carries 300 gallons of fuel, which is sufficient for many hours' flight. By doing away with the armament and other military equipment of the N. C. 1, its cruising range might be increased to 40 or 50 hours without

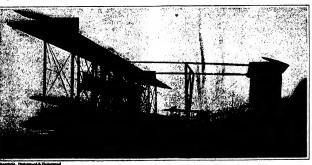

difficulty.
Given ideal weather and

good seamanship, the N. C. 1 or a similar craft ought to be able to make the transatlantic flight. In fact, it is generally held by those who know that such a flying boat can readily be prepared for the flight with every prospect of success. Because of its sturdy construction and its ability to alight on fairly rough water, the flying boat possesses many advantages over the land type of aircraft. In this connection Mr. Glenn H. Curtiss has recently remarked that marine flying will be developed quicker than land flying, because no new land-ing fields are required. Terminal facilities are already provided, for quiet harbors, rivers and small lakes are

2 Sept to Contract AND THE PARTY OF T The N. C. I flying boat as viewed from the rear, the three engines and their four-bladed tractor screws

> type as the old "America," equipped with two Rolls Royce or Liberty engines aggregating between 600 and 800 horse-power, and capable of maintaining themselves in the air and on the water for long periods.

> More recently our Navy has come into the possession of a still larger flying boat, designed and constructed by Glenn H. Curtiss, which may well be included in the

view of the giant seegime, showing the biplane tail with balanced elevators, at the end of the entrigers

Peace Parley Problems

What Should Be Done With the German Fleet

By Hudson Maxim

If a league of native set be practical or workable at wall be necessary to the Britain and the United States to agree up to the say of their respective mand building programs at it agree upon the size of their respective said prospective, like to five are unable to agree with Great Britis upon the division of the Geometric Consecution. German fleet we certainly can not hope to agree upon anything in the world especially upon a more difficult matter still that of the size of our respective future

buch a league t enforce peace would not be a peace league but a war breeding league if the two largest mations that are perfect to it are to enter upon a race for navil suprema to Nuch a race would in itself be The rivalry letwe r Germany and Creat Britain in fleet building was a war to the kinfe and the actual war with the kinfe can t in 1914 as the result of it. It momenths height of impolicy for us now to throw down the gauntlet to Great Britain and take up the race for

the gauntice to terral Britain and take up the race for naval suprimary where (many lett off). We need no defens against (reat Britain on the Atlantic any more than we have needed or now need any defense on the treat Lakes. We do not need to fortify the was to protect ounce less against Great Britain. any mor than we need to fortify the Great Takes With all her iket and all her armies Great Britain is utterly disarined against us because she would have nothing to win nothing to gain from any dissension or war with us but everything to lose

war with us but overything to lose

Grat Britain does not for the loss f Canala to us
otherwise she would want to fort fo the Crist Lakest

If Great Britain should go to war with us she would
inevitably loss the Dominion of Canada to us and that would more than offset any possible advantage that she could gain from the prowess of a superior fleet. No power on earth could stand before the American arms on this continent if we profit by the less ins of this war and prepare according to our needs

In the event that we am not agree with Great Britain with respect to the division of the German fighting ships why not sell them to some of the small nations who are building fighting ships and who would be glad to buy them? How about Brazil Argentina Chile

The money rused from these slups would go far toward reimbursing Great Britain for her losses and expenses in the war and we shald welcome an oppor-tunity to help Britain in this way. Britain that for the first three years of the war saved our land from the threat of invasion and spolistlon

Before the Great War we used to talk in millions when we discussed naval and military appropriations and re querusous navas and murary approj riations and congressional expenditures but since the war we have got so used to talking in billions that we have evidently lost much of our sense of proportion. A billion dellarlost much of our sense of proportion. A billion dollars represents a sum of money which to raise from the hun dred inillion American people would require a tax equal ures immon American people would require it alse equal to ten dollars for every man woman and child in the country. The German flect is certainly worth more than half a billion dollars. Now think of the silver folly of wantonly destroying property of stich colossal value while we go right on building new fighting slips.

If our naval program is carried out and we enter upon a race for naval supremacy with Great Britain as contemplated and keep up with Great Britain-because she will continue to build if we do- it means that the American people within the next ten or fifteen years will be obliged to bear a burden of taxation equal to fifty dollars a head for every man woman and child in the country amounting on the average to \$250 per family and there will be a colossal annual tax for the expense of upkeen maining and running such a navy
Is there no way to protect the interests of the American

people against such colossal folly!

No one can accuse me of being a small navy man am as strong for national defense as any man living. But the fact that the people of Great Britain and ourselves are mainly of the Anglo-Saxon breed with common ideas and ideals aims and ambitions is the strongest possible We should league ourselves with element of security We should kague ourselves with Britain as our own States are lengued to one another, and there should be no more cause to fear Britain than for one of our States to fear another State

Great Britain's fixed habit of good behavior is the greatest guarantee of world peace. It is greater than

any league of nations It must be borne in mind that Great Britain has more payy than she needs at the present time, and while we may need some naval increase we do not by any manner means need a navy as large as that

We must bear in mind the fact that Great Britain is differently situated from the United States of America If the continental area of the United States were to be it the continents area of the United States were to be out apart into as many islands as there are states, and there islands spread over the seas of the earth then we should be in a postton largely like that of Creat Britain, and we should then need a larger fleet than we now need up us as Britain needs a larger feet than we now need Britain a life is her fleet. Our life is within our continental confines and our fleet is an auxiliary. We could with a little time for adequate preparation defend ours? by indefinitely around the properties of the continents of the c

we could with a fittle time for adequate preparation defined ours tives indefinitely against the world in arms, even though our fleet should be destroyed and all our outlying possessions captured and we should also be able to feed ourselves for an indefinite period, even though all connection with the outside world should be

But Great Britain is situated otherwise. The British lsles and all her colonies would be absolutely at the intry of any one my that should be able to overcome her

We do not need so much of a ficet as does the widely we do not need so much of a fact as those show vices, statered British Empire In case of war with Britain, which is now an absurd supposition she could under no circumstances concentrate her entire feet upon any point of our shorts. We should still therefort, have a preponderance of fleet power where needed a power suffi-cient to protect the Panama Canal even though our fleet should be incomparably smaller than that of Bi

We need a feet in the Pacific Ocean of a size sufficient for our protection against any Asiatic Power or combi-nation of Powers With such a fleet we should be able to protect our continental areas from aggression from

any British flot t that might enter the Pacific
Although it is my opinion that war with Japan is now
most unlikely still I believe that we should have a fleet of sufficient size to make any war with Japan equally unlikely in the future Japan is so situated today that she could only lose by a war with us I he lapanese are far too win and practical to go to war with us

far too was and practical to go to war with us. In conclusion let me call attention to the pertaient fact that no American at the present time has the least fear of Great Britain. It is inconceivable that Great Britain abould take advantage of hor tremendous naval preponderance and her preponderance in highling men and munitions of war to commit any acts of aggression against us, much less to go to

Our comradeship with Great Britain in the war has Our collinacesing with orders britain in the war are bonded the two nations in strongest title of obligation fellowship and admiration, and this bend should now be utilised and jouned with the bond of a league to compel good behavior of all the nations of the world

It is time that the two great Anglo-Saxon nations should get together and stand for world welfare

Road vs. Load

DURING the stress of the past 18 months our high-ways have been used and abused as never before, and they have not always stood up well under thus treat-ment. The wear and tear of the constant passage, at maximum speed, of heavy trucks heavily loaded, and even of trains of such trucks, has taken a severe not built for such a streamous life

It has been obvious for some time that in mere self-It has been obvious for some time that in mere self-defense we should have to him the loads put upon our highways. It is all very well to say that the highways should be equal to the demands but thus is true only within proper limits. Every engineering structure has it mannium capacity. the Brooklyin Bridge will carry a given load and no more, the foundations of the Wool-worth Building will support a given weight, its walls will worth Studing will support a given weight, its walls will withstand a given wind-pressure, and no more. In cases like the last-named we can calculate in advance the greatest load ever possible, and provide a margin of safety above it but with the load is one imposed by human action as an the inflatmon of the bridge and the highway we can newer tell what demands will be made upon our struiture key dru successors, and so can never make certain that what we build shall continue to give service until it wears out naturally service until if wears out naturally

To the extent that roads built for passenger and farm

service are now being out to pieces by through and local

interurban freight traffic, the demand that such teaffic be regulated in a reasonable one. To the extent that reads built to support the normal trucking of five years ago are being torn apart by five- and test-ten trucks and long knes of vathers, that demand a reasonable. To the extent that no matter how strongly we build a fond, a load can be imposed that will break it down, that demand is reasonable. But—in meeting that demand we must be reasonable toward traffic as well as toward the read-builder having permitted the pendulum to eveing too far in the interests of the former, we will avert correct for an the interests of the former, we will avert correct durection. We want to drop it in the middle of its path, gruing to all concerned their just due. A Committee of the Highway Transport Commission of the Council of National Defense has discussed the question of a uniform traffic law for federal adoption or for recommendation to the various states. At present

question of a uniform traffic law for federal adoption or for recommendation to the various states. At present such traffic laws as cust are so different in different neighboring states and different in clattices as to cause confusion and annoyaire. If the Committee does not succeed in its efforts to bring order out of chaos, the continual snackment of further regulations by various local or state before may be experted.

local or state bodies may be experted.
At the present time there seems to be a tendency, on
the part of those interested, to favor a maximum load
of perhaps 12 or 14 toan per unit—the figures immaterial
it seems to us that this is not the intelligent treatment
of the case. Somebody has pointed out that the largest
tank or crawling tractor can travel over ground that
would be impassable for an ordnanity about lady—because would be impassable for an ordinarily stood aday—because while the machine weighs many times what the lady does, it has so much bearing surface that it brings less weight upon each square inch of its supporting ground than does milidd in her French heels and posted toes it seems no more than just to recognise this principle. in the matter of highway overloads

A weight that would smash cleanly through the road if

supported on old-fashioned buggy wheels, and that would cause serious wear and tear if transmitted to the road-surface through the ordinary truck tires, would be supported in perfect safety if it rolled along the highway on the traction belt of a crawler or even on the rollers of a steam-roller. So the sensible test for limit loads would

seem to be so much per tire inch

course there is a limit beyond which unit loads should not go—sumply because there as a limit beyond which distribution cannot go A load of 1,000 tons would be supported without damage by any roadway, if it were of sufficiently wide distribution But so 1,000 ton load sould be sufficiently widely distributed while remaining mobile on wheels or substitutes therefor remaining mobile on wheels or substitutes therefor so it would be proper enough to specify that no axis shall bear more than a certain lond, and that no two axies shall be less than a certain number of inches apart. But this is as far as the restriction of unit loads on blunds

Again, experience has shown that a tire which is not Again, experence has shown that a tre which a not mighest to tractive strain need not be more than half as wide, for a given weight as one that is subjected to tracion. Therefore, should a right recommendation be made for a certain limit weight per tire-inch, it would not be fair to the trailer owner who would then have to use bigger tires on his trailer than necessary. In fact, the time themselves afford excellent argument in favor of this course. There is no better way to tall the relative damage done to the road by various classes of rought than by assuming that the highway suffers in proportion as the teres suffer. In other words, if a dual 6-tich live on a driving wheel and a ample 6-tinch tire on a non-tractive wheel wear out at the same time, it is safe to action the son. a triving wreet and a langue o-men hire on a non-tractive wheel wear out at the same time, it is ease to assume that the one has done about the same damage to the highway as the other. On this bests, the maximum weight per ture unch should be set at one figure for wheels he which power is applied, and at a higher figure for non-imactive or the state of t

whoels. Figures that have been suggested by one well-informed person are 500 and 1,300 pounds per tire inch for these two classes, respectively. From the same source comes the specific renormandation that no acid be permitted to carry more than nine tons, and that no acid be set elsew than 100 inches. The important thing about all this, however, it not so much the figures are it is the ideas involved. To all busiles that are contemplating legislation designed to relieve our rease from the destruction that has been wrought upon them by excessive inseter careful, we semestly commend that limited the busiles set facilities.

Review of the year 1918

(Continued from page 8)

before we were told of the wireless telephone which paramitted the orders to be issued from a ground station Badio communication over long distances has been greatly improved by numerous mventions which, on the whole, remain military secrets fitstut the archenemy of long-distance waveless, has been definitely conquered, according to a recent announcement of the Marconi organization, and the tall mests and elevated automa usually uses cited with radio have been replaced by low masts and an tenne, marking a new era in this breach of communication. and of communication .

breads of communication.

Not to be outdoor by radio, the land lines have come in for a number of improvements, among them a new multiplex system which permits of increasing many fold the present islephone and telegraph capacity of wires actionsatic telephony has come to the front in a big way, and because of the severe shortage of help the largest telephone companies have had to consider the sutematic telephone for use in the leading cities. In the flad of electric illumination, the progress has been considerable. Flood-lighting has found now provided to the control of the control of

Militarity, there was little achieved in the electrical Bald; for, as already stated, this force is a peaceful force However, in the course of the past year the Germans introduced their crewless raiders in attacks on the British monitors operating off Flanders Thus they put into practice an idea which was by no means new, but fortunately, thanks to the vagilance of the British put into practice an idea waten was by no means new, but fortunately, thanks to the vigilance of the British craws, nothing came of the German scheme On land electricity found such military uses as charged wire antangiaments, improved X-ray outfits and portable lighting plants

The past year has been a great one for seronautics Vast strides were achieved in practically every branch of the flying art, and the twelve months of unpercedented affort were fittingly crowned by the fifteenth anniversary of the first flight by the Wright brothers, which took place in the sand dune of Kitty Hawi, N. C., during Documber, 1000 by the demonder of the military land.

Spured on by the demands of the military leaders, the leading acronautic constructors statisned their divers goals just prior to the signing of the armistuce primit planes for fighting purposes had been developed to a point where a speed of 128 to 150 miles an hour was a fest accomple rather than a product of finagination Giant planes of the long-distance bombing type were beginning to make their appearance in wast numbers Germany had constructed a number of Gotha-Lesens planes capable of carrying fire tons of bombing points out of the purpose of bombing points out of parts. Handley-Page machines fully as large as any German plane, for reparing Germany in its own oom. The Albes had contracted extens feets of small and meduma-ward dirpthies Spurred on by the demands of the military leaders, ing Germany in its own com. The Allies had constructed entire floets of small and medium-sized dirigibles for naval work, as well as numerous large and fast flying for nava wors, a well as minimized as the state of the photose carrying thousands of pounds of explosive for the limiting U-bosts. The armament of fighting planes had been developed to a high degree, so that some planes carried as many as an guns, and few had less than two All in all, and from a military and naval point of view, the seronautical constructors have quite fulfilled all of

America's progress has been stupendous during the past 12 months. After many disappointments and set-backs, our serial program at last got under way. Thou-sands upon thousands of Liberty motors and De Haviland money our serial program as tast got under way. Thousands quit shousands of Liberty motors and De Haviland invo-sestes made their way to our battle lines in France, where the unanch of pilors and other serial personnel were ready to man them Also, our sewralt constructions succeeded in turning out excellent copies of the British Handley-Rays and the Halan Capronis, equipped with the Liberty motors. Our Newy completed with Halandy-Rays and the Halan Capronis, equipped with the Liberty motors. Our Newy completions gain from the Liberty motors. Our Newy completions gain the Liberty motors. Our Newy completions gain the Liberty motors. Our Part of the Liberty motors in the Capronis of the Liberty motors. The Liberty motors have been introduced during the past year. The winged postures is dust become quite summonplace, with one route sign manufacture of the liberty motors of the later month of the past year. The regards have seems front all the beligueent sountres tabling at the year efforts being expended in converting the plants of the way the rightness of pasce. All of which prestraint, most for the believe of aeronautique.

Chieffith.

injustration of the year's chemical advances has

Reactions which in the laboratory proceed in test tubes have been put upon a commercial basis of quantity of production that would astound the chemist of a genera-tion ago, who would perhaps fall to recognize the opera-tions as those of chemistry at all so altered is the method of attack. The years developments have been so strongly along these lines that we must catalog them in

strongly along these lines that we must catalog them in terms rather of the factory than of the laboratory. The coal-tar chemist assures us that he has solved the last of his big problems of dye manufacture. The knowledge of principles and methods gained by the Germans has been so systematically withheld, and even falsified, that that knowledge cannot be said to have constituted part of the general body of securic The labors of the past three years crowned by the results of 1018 have mediated under the control of the past three years. 1918, have m de it such a part

In glass-making the years developments are even nn gnos-making the year a developments are even more striking, glass is produced today superior to anything ever known, both for optical and for other use Our ability to handle paper Nature a composite has been advanced far, so that this substance is inding a surprising variety of new uses. By an alliance between the elemist and the mechanical engineer the process of dehydration, which means so much in the world's food supply, has been put on a solid foundation. At the same the chemist has made the world less dependent on a single cereal by showing us how to make good bread with a minimum of wheat

As a result of concentration upon the problems of gas warfare, a large and valuable hody of knowledge has been built up with reference to the toxic effects of a wide variety of poisons, and the proper antidotal and preventive measures. At the same time a number of commercial gases have been developed and some old ones are being manufactured at a fraction of their former

Among the purely research activities completed during Among use purely research in invites complete during the year, we must ment into two undertakings of the Bureau of Mines The first brings (sheaper radium closes to realisation, the second identifies the character istic property of selmum in a number of other metals and oxides all of which show an electro resistancy vary ing more or less markedly under the influence of light

Under this unclassified heading perhaps the most important thing to chronicle is the acceptance of the motion picture as a new scientific instrument coupled with the microscope at normal or abnormal speeds, as a means of actual research or as an agent for proving results and spreading knowledge thereof the moving film has this year proved its place it now ranks with the camera and the introscope as one of the recognised optical tools of science

rhaps in no field of science has the war stimulated such sudden and such notable advances as in that of the psychologist He has had unprecedented op-portunity to observe the behavior of men under con dutions of stress and he has been called on to make tests, and perforce to device purlames and methods of test, on a scale never before contemplated proved his technique to himself and to others so that now stands on a level of acha vement and recognition that he could not have attamed in years of normal

Other interesting developments of the year include Other interesting developments of the year include quantitative spectrum analysis and magnetic analysis. The former makes available as an accurate means of determining becomingse, what has hitherito vasted only as a means of preliminary qualitative test the second opens up a broad field to the strength-of maternias sugment, who has seldom been alst to devuse a test that did not destroy the material subjected to it.

At first blush, one would be inclined to class the work of the astronomer among the non-essential occupations. To be sure, his studies take him far beyond the may mis-To be sure, and studies take him for beyond the insurint-cent speck of the universe which is our jabilita ion Nevertheless, thuy as is our earth, to us who cwell thereon, the swants of the past four years have bet a of paramount importance. But in reviewing the recent work of satironnesses we find that they have taken a very paramount importance But in reviewing the receiver with of astronomers we find that they have taken a very work of astronomers we find that they have taken a very and of our Allies have been very hour teaching in the navagation schools, besting operals instruments improving the work sof the raise finder and even operating at the very Frint. Despite the handcaps of war a considerable amount of research work has been done in the past year. Two comets were discovered, the first at Cape Torm, by Reid, on June 12th, and the second by Geherr, at the Eastburg Observatory, on November 22d cheer, at the Eastburg Observatory, on November 22d the sun, he arrived at the startling conclusion that there is wakey wayer and sagmons vapor in the sun a atmothe sun, he arrived at the starting concilient that terms is water vapor and shipments vapor in the sun a atmosphere. Heretofore, it had been supposed that the meanes heat of this luminary would prevent the formation of any elemical compounds, but this supposition

needs revision in the light of Fowler's researches Long photographic exposures lasting 70 hours have shown that the inner portion of the nebula of Aidr neils rotates at a speed of 50 miles per second from which it is estimated that the outer portion probably at uns a speed of 200 miles per second. A small star rear Alpha Centauri lays claim to being our nearst companier Its distance has been estimated a between 41 and 13 light years from us It is a cool star only one thousan lib part as bright as the sun

During the year there were three compses of the sur and one of the moon. The most amportant echase was that which took place on June 8th when the shadow of the moon event across the Hutted States from Oregon to Florida in a belt from 70 miles to 50 miles in width as the first total eclipse that we have had since May By a remarkable concidence on the day of the eclipse a new star was discovered in the constellation of Aquila, which was the brightest star to make its appearance in the last three centuries lit reached the magnitude of 1.4 almost that of Sirius Photographic records of that portion of the sky taken at Harvard I inversity show that on June 3d it was of normal brightness Owing to cloudy weather that region was not photographed again until the 6th when the star appeared had increased 200 times and it was clearly visible to the naked eye—in fact there are reports of its having been seen although the news was not transmitted to any of the astronomical observatorica of the 7th and 8th its brightness had increased 100 000 times and then it was so conspicuous an object that times and their is was so compared as a correct man-reports of its discovery were telegraphed to Harvard Observatory from all parts of the country Another nova was rported on February 4th in Monocores which reached a magnitude 54 on Jacoury 1st although its magnitude was 85 when discovered. In March Wolff magnitude was 85 when discovered. In March Wolff reported a faint object which at first was thought to be a comet but it proved to be an asteroid with a period of four years. This tiny member of the solar family has a four years. This tiny member of the solar family has a dismeter of but two and a half miles. After having been greatly delayed by the war the

Smithsoman Institution has at last established a solar constant station at (slams (bile at an altitude of

Proposed Swiss National Trade-Mark

COP's of the regulations under which it is proposed A by Swiss chumbers of commerce to establish a Swiss national trade mark under the name of S P F S (Syndicat pour 11 xportation Susse) discloses the fact that the mark will be confined to firms two-thirds of whose capital is Swiss and to goods that are made in Switzerland exclusively by the Swiss Thus any foreigners manufacturing in Switzerland will not be able toregners manufacturing in Switzerland will not be able to use this trade mark for goods manufactured by them in Switzerland. Ih object of the trade mark, it is stated is not to place foreigners at a disadvantage, but to ensure that any article bearing S. P. F. S. are to be really of Swiss manufacture. In addition the mark really of wise manufacture in addition the mark is directed against German penetration, as numerous firms are known to be ostensibly Swiss, but in relity German. The president of the Geneva Chamber of Commerce states that the control of these will not be easy but the committee is alive to the probability of improper use of the mark and they consider that it will improper uss of the mark and they consader that it will be necessary for Yssus manufacturers to bring cases of this character to official notice. No foreign firms are to be prevented from manufacturing in Switzerland but not being Swiss, they are to be debarred from using the trade mark. With regard to the possibility of the extensive missis of the trade-mark [by exporting merchants it may be necessary to add the manufacturer's name to the trade-mark This may not be acceptable to exporters and if impracticable and the trade-mark fails as a result to protect bwiss manufacturers, it is con-sidered probable that the chambers of commerce concerned will propose its abolition

Preserve Your Papers They Are of Permanent Value

BY taking a little trouble, when a paper first comes to hand it may be preserved to form a permanent and valuable addition to the reading matter with which everyone should be supplied. We furnish a neat and and valuable addition to the reading matter with which everyone should be supplied. We furnish a neat and attractive cloth board binder, which will be sent by mail prepaid for \$175. It has good strong covers on which the name Scientified American of Scientified American SOFFLEMENT is stamped in gold and means by which the numbers may be securely hold as in a bound book One binder may thus be made serviceable bound book One binder may thus be made serviceable for several years and when the sucressave volumes as they are completed, are bound in permanent form the subsenber altimately finds himself for a moderate cost in possessions of a most valuable addition to any library members of the subsender altimate the subsender alti

The Dogs of War

What the Canine Has Contributed Toward the Allied Victory

THE dog may well be proud of his splended record in the great war. For while acknowledging the great services rendered by other military animals such as the horse mule and arrier pigeon the dog has the distinction of having served in the front line trenches and even out in No Man's I and where only the bravest dand vinture

It was quite natural for the Belgians to employ dogs in military operati us as they had been doing in the days of peace So early in the war the Belgian machine gons were mounted on light carts and drawn by trained dogs with the result that the few machine guns availal to the Belgian army accounted for more than their due share of German invaders because of their extreme mobility

Other armies soon introduced trained dogs

of the range soon introduce trained dogs in their organisation using them as watch dogs and despatch carriers at first and later for carrying to 1 and ammunition to the first line as well as medical supplies to the wounded lying about the battle fields Indeed the dogs have constituted a distinct and recognized branch of each of the leading armics with recruiting bureaus training camps ex-quarters behind the lines and claborate hospitals

During the last days of the great war the I rench army had some 10 000 dogs in active service. These canines were employed as sentincis out in No Man's Land where the keen senses of these four legged com Land where the con scheep of freet four right down betants parse warning of hostik provices long before they could be detected by the polus. Dogs were also employed to guard prisoners and thanks to carful training, in distinguishing the polul from the Boche canner guards were used to a considerable oxient thus

One of the extensive kennel parks for the messenger dogs serving with the British armies in Prance

relieving large numbers of French soldiers for more important duties. Still another use for the war dogs was in the carrying of despatches across territory under fire As a lasson agent the dog was found to be without equal for these four-legged country passed unfalter-ingly through barrages and areas under machine gun fir, where it would have been worth a man a life Even in gas souked territory the dog couriers were employed in gas sourced territory the dog coursers were employed being equip ped with special gas marks for just such cr cumstants. And then there is the all important ques ton of maintaining the supplies in front line positions under enemy fire. Here again the dogs served ad mirably in bringing up food and ammunition to the beleaguered troops

It has long but n recognized that the question of n

taining supplies is one of the most diffi-cult to solve in the usual trench opera-tions. By the use of an intense stiller-harrage it is possible for an enemy t-isolate any green bit of trench system-almost as effectively as if his troop concrided it. Apprenating the possibilities of the war dog as a carrier of supplies is small quantities the French worked on the amai quantities the French worked on the form of supply service. Special harnesse and carrying pouches were developed to all kinds of supplies and dogs were traine to carry various articles ranging from ho soup to hand groundes for the trench de lenders.

The results of some of those studies a The results of some of these studies as ahown in the accompanying group o photographs made at the Franch military that the companying and the franch military and the companying control of the second view shows a four-legged ammuniton carrier in this case provided with pouches holding the apply of greates shown beautiful military with his label of the companying and the short of the companying and the companyi

It will be recalled that in previous descriptions and discussions of this small cannon which is a form of so called accompanying artillery, the difficulty of maintain ing a steady and adequate shell supply has been pointed out in these columns Apparently the French have

The poilu who is a tremendous bread eater, receive his daily bread up in the front-line trenches—German barrage or no barrage—thanks to the services of the do

shown in the fifth view. This dog carries is loave in one try. Likewise the machine game, which simply derour cartridge belts or clips, must be supplied constantly if a poution is to be held. And have is where the dog shown in the sixth view comes in for his share of service carrying 250 rounds of ammunition at a time. In the ensiter of curth view appears a row of kennels at Camp Satory. During the year 1017, owe were returned war dogs were treated for wounds and aliments, of which 4,168 were returned dog spotialists of France are engaged in carring for the thousands of war dogs and the medical and surgical facilities, as shown in the view to the right, leave hith to be desired.

The war dog has a distinct application The war dog has a distinct application in the resonstruction period of France and other countries. As a companion and guide for the blind soldier, the trained dog continues to serve the nation. For the wounded, there have been developed that the applications of the server of the se light two-wheeled carts drawn by one or two trained dogs, and it may be that vehicles of that kind will be the means of abling many a crippled warrior getting

about in the coming days of peace A war police duty the war dog is well fitted with practically no additional training, in fact the first war dogs came from the police departments of Pazis and other leading cuties of France

It so happens that the writer has come into the precession of facts and figures concerning the French war ogs only but there can be no doubt that the British and cogs only but there can be no count that the stream and the Garman armine have employed dogs just as extensively and thoroughly. There has been no monopoly in the enightment of dogs in the great military operations on all fronts and once again the dog has proved to be man a greatest friend among all animals.

Molded Airplane Propellers

IT is customary to make airplane pro-pellers of laminated wood. Layers of veneer of various woods carefully se according to various qualifications of ten sile and compressive strength and of toughness are cemented together and built toughness are cemented together and built up into a solid block, out of which a propeller is carved. One disadvantage of this system is the fact that the propeller blade has a lamnated surface and the edge of the laminations on the working face of the blade are required to strike the air as the propeller is revolved, and there is danger of ditting them apart
To overcome this objection a molded

propeller was designed and found consider-able use abroad, as well as a certain amount of limited use in this country during the war. In this type of propeller the laminations are twisted to the proper form and then are comented together so that the working face of the propeller represents an unout surface of veneer The method of forming these propellers is illustrated in the accompanying engravings. The layers of veneer the accompanying engravings. The layers of veneer are laid upon a block of wood shaped to the form of the

A war dog on the operating table at the military dog hospital, Camp Satory

working face of the propeller Between the lower three wooden layers, that is, the ones adjacent to the working face, there is an interlining of linen. The layers are comented with a glue made of coarm and line. This is mixed in a high speed churn just before using and has to be applied within fifteen minutes of the tip cit is mixed. The cement is applied cold. The laminations of the propeller are firmly clamped by means of wooden blocks.

なるないのでは P WY AND THE S 11 272

Stages in the construction of the molded propeller

as shown in the photograph. In this position, the propellicr is allowed to set. The glue is of such a nature that it will not be affected by heat or by mosature. The propellers may be boiled for hours without showing any tendency for the laminations to separate. After the cement has completely hardened the back of the propeller is shaped by hand but the working face is practically untouched. The propeller is then given an impregnating bath to close the pores of the wood and then pigskin rawhide is shrunk over the outer ends. The final operation is to varnish the propeller

By this means of construction it possible to obtain a much narrower hub and by setting two propellers at right angles one to the other a four bladed propeller is obtained with a thickness of bub scarcely greater than that of the com mon two blade i ; repeller

The Current Supplement

THERE are vist expanses of country in South America that have never been visited by white men and about which little or nothing is definitely known One such region has in the interior of Venezuela and is inhabited by tribes of the Motiline Indians who have been reputed even from the times of the carly Spanish adventurers as the most warlike and dangerous of any of the inhabitants of the continent Last summer an American explorer succeeded in penetrating this region where he spent some time with the natives and an account of his adventurous observations will be told in the Scientific American Strply MENT the first installment appearing in the current issue No 2244 for January 4th under the title of The Macon Indians of

The narrative is acc inpanied by a number of original photographs taken by the author Many about which scientists have but slight knowledge it has been discovered that these pigments serve other useful and necessary functions besides that of decoration Some account of the subject will be found in a paper on The Anthocyanin Figments in Plants The Oyster Feeds Both Man and Plants tells how the shells of

Both Man an Plants tells how the shells of these popular by valves are utilized as a valuable fertilizer and it is accompanic if by a number of photographs. Another interesting paper is on A Pisched Raceball which explains and illustrates the ration ale of its many freaks. World Markets for American Manufactures

Edited by LYNN W MEEKINS

A department devoted to the extension of American trade in foreign lands

The Adaptable French Soldier

It has been proved in reithin once turing the last four years that it breach would rethre high than eat. But now that it kaineral borns has ended the war they have gib lack to the firm and further girls it breach soilly casein, shell holes with plowed

girth I French sont ty classing such noise with power forrows from which boundful or jaw all spring I odds, the farms of France need implies mis said equipment of many kinds from hose to harvesting in admirty. The I French Departments or political divisions are taking active measures to promite the back to the land movement. This is being dure by offering at-Programment of the Lore for metance a minimum of from 20 to 25 acres may be allotted to each man not over 15 years of age, who will promise to remain 10 years at th head of his farm. He will be supplied with about \$200 worth of modern implements and loaned additional equipment not exceeding \$400 in value for which he has 15 years to pay In order to encourage large families part of this will be canceled according to the number of children born after the farmer has taken possession of his allotment of land. I rough milk and factories need workmen but the actual restoration of the country is squarely up to the farmer and agriculture has replaced military service as a patriotic duty

Two Factors Limit the Market

The American manufacturer of implements and ma chinery however should not overestimate his op-portunities for stocking French farms with his products. In the first place French manufacturers, more familiar

with the different kinds of soil in their country are meeting with much suc-cess in turning out the equipment best suited to it. That the domestic makers are not going to let the United States run away with the trade is shown by a statement of the President snown by a statement of the Freud at a of the Syndheatt of Implement Manu-facturers who said that 'if the Muns-try of Agriculture will lay down a set program we will undertake to furnish French machines corresponding to the type of American machine ing to the type of American machine indicated as a model and of equal quality at an equal price even if we have to make sacrifices to do it in the second place the French Government has no intention of countenancing extravagance and to prevent the competitive bidding that would result in it all buying is closely

the Paris representative of an American machinery corporation who recently visited the United States, consortiums or in-

dustrial associations for importing various lines. The farmer who needs a harvesting machine applies to the consortium desiing in farm implements If it cannot be supplied by a French manufacturer the organization will import it and the American manufacturer may sell it through this means

its many vineyards and small estates—are favorable for the introduction and sale of horse-drawn cultivators, harrows plows and other implements. Most sections of France though are calling for tractors and this is the line offering the principal opportunity to the American manufacturer

Isles of Plenty

T'S good to see the sugar bowl on the table again! remarked a prominent exporter at lunchoon the other day Just think for a moment what that signifies We are receiving more signifies We are receiving more signs from abroad and the welcome sinps that bring it can take more of and the wearome ships that bring it can take more of our goods back to the sugar-producing countries, which are elamoring for them and have ample messay to pay for them With Cuba nearby across the Strats of Florida, the United States is doing a vast amount of

with the Dutch Fast Indies, far across the business with the Dutch Fast indice, iar across one Pacific Ocean we can build a large and profitable trade if we go after it. The latter market is of particular interest because it offers valuable raw materials— rubber in vegetable oils and fibers—in sexchange for all sorts of American manufactures. It is the world's all sorts of American manufactures It is the world a third largest purchaser of cotton cloth it needs con-siderable quantities of modern machinery for sugar-plantations for a rapidly governing oil industry, and for mining and there is no limit to the prospect for the sale of medium-priced automobiles are mong our most distant the Dutch East Indies are among our most distant customers and our business with them can never be of

ruscomers and our ounness with nem can never so ut the mail-order variety. Nevertheless, it is comparatively easy to trade with them because most of the important firms have opened branch offices in the United States to buy our goods and to sell theirs as the respective lines are non-competitive. It is a great advantage to both countries to conduct trade in this way.

How Germany Obtained East Indian Bus

The Dutch have always been among the world a great The Dutch have always been among the world a great randers. Before the war both the Netherlands and its best Indian possessions dealt chiefly with Germany The reason for this is obvious. Germany a railroad extend to the looder of Holland its waterways traverse that country. It is not simple for Germany to deal with Holland as it is for the United States to trade with Canada and Holland of course controls the trade of its colonies which have an area St tunes as great that of the mother country and a population more than six times as large American trade with the Dutch The lack of an American merchant matine before the war enabled the Dutch to carry our shipments to the East Indees by way of Holland With our own ships, and with the development of sufficient interest among American exporters, we can retain and add to our present direct commerce The "Shipment Sample" Is Imp

One American firm has built a successful bunness with the Dutch East Indes in this way. A representative was sent to that territory with a full line of samples. He showed the colonial merchants just what his firm had so showed the colonial merchants just what his firm had loo offer, and he received surprangly large untils orders. In making shipment, the method of packing specified by such customer was carefully followed Resconsible credit was extended Because b was on the ground, the sakeman learned of the value of the "shipment sample". This does not represent the groods to be shipped in the future, but it is taken directly from the actual shipment as it goes forward. When the construction of the shipment is a single property of the proof of the shipment as many constructions of the shipment as many constructions. Need-the set one, reddless difficulty is caused if there is the alightest difference between the 'shipment sample' and the goods.

Can We Sell Electrical Goods in France?

THE world's coal supply has been thrown out of gear by the events of the war, and the use of hydroelectric power has advanced rapidly lelectricity as as great labor-saving source will have much to do with the coconstruction of France and Belgium, and it would seem that American and it would seem that American and its world seem that American will be called upon for manufactures will be called upon amanufactures will be called upon any alectroal devices. An engineer who has made a close study of the Freuch market for 25 years believes that material, if not radical, changes that material, if not radical, changes that material, if not radical was not not to the state of the state American exporters who expect to dispose of their goods in France, where the methods of installation and

American exporters who export to dispose of their goods in Franco the dispose of their goods in Franco the standards of quality are old-habitoned, to say the least. Ten years got, thus engineer étaid, there was not a magie electrical winn justilation in France that would pass the requirements of the National Board of Fire Undewruters in the Unstell States. "American methods and materials make the cost per outles probabilitied by many and a French importers," and electronal supplies. Booame cardesances is not a national trait with a the fire losses due to electronal installations in Franco are not one-tenth as great as the inseas from similar scates in the United States, in spirit of our crude deveces, so we naturally think that such deveces are good enough. If Americans will thank simple and has perfect appliances which will be changer to produce, thereby lowering the selling perior. In Presche markets offers are the importer thinks that push-button switches of the American will are the proposed as personal to the control of the selling perior, the Presche markets of the American type would be regarded as between, in France, where the average force of out-out now used would probably not have been allewed in the United States even if years age. The wiring of French fictions is very infection in American type to the Presche States in the Presche theorem in Presche conducts being understaller to the Presche States is severy infection in American products and the American type of the Presch States is the Presche theorem in better the Presche States, and the States is severy infection in American products and the American type of the Presch States is severy infection in American products and the Presche States and American type in December 10 to 10 to

American three-horse kurvester used in France

East Indies used to pass through Holland, but the war East Indies used to pass through Holland, but the war interrupted communication between the Notherlands and the East Indies so that although the mother country continued to be dependent largely upon Cermany for its imports the colonies had to lean upon the United States and Japan, each of which has increased its ex-ports to the islands about 300 per cent during the last two years.

American exporters did not seek this large volume of business. They failed to study the requirements of the market and they did not push their lines systematically, so the Dutch colonial merchants came to us, and it will be decidedly to our advantage to make them welcome Java a Market for Quality Goods

Java a Market for Quality Goods

Commercially Java as four-fifths of the Dutch East

A Natural Derrick Mast

IN connection with the recent unpleasantness, it was found secessary, as pointed out in the public prints from time to time, to get out from the forests of the American northwest a great deal of lumber with the unmost naste One lumbering concern in the state of Washington hit on an ingenious expedient for saving time with each change of location—doubtless an ex-pedient that has been employed before, but never, we suspect, upon such a scale or in such a deliberate manner Wherever it was necessary to have a destrick, search

suggest, upon such a scale or in such a deliberate manner Wisserver: It was necessary to have a derrich, search was instituted for a tree sufficiently tail and supplied to the search of the sear

Growing Cotton for Tires

THAT an affinity should exist between automobiles

A and cotton seems unbelievable, but the fact remains
that one of the largest tire manufacturing companies world has found it necessary to go into the bu of raising oction of a superior quality in order to insure an adequate supply to meet the increasing needs of its factory. That this is true is but another example of an adequate supply to meet the increasing neous on inforcory. That this is true is but another example of the complex nature of modern business, where one moderty is vitally dependent upon another apparently as far resmoved as the poles. In the manufacture of autoscioble idees not of the chair exquanter is inogrataple coston, a variety that is exceedingly valiable and hard togst. Until a few years ago noses of this variety was produced in this count, a morphily Egypt. The present modern of the county of the content of the county of the content of the county of the count

throughout the Bouts, we have continued to the Bouts, we have cotton whose others grow to unusual length such as Sas lakend and Egyptian varieties. To produce this long-staple outcom requires the continued observance of a number of conditions unusually beyond the power of a word of the summer of the power of the summer of the of any one grower to maintain It requires community growing to insure an adequate supply of pure seed, to keep out weed and insect enemies, to turn out from the keep out woed and meet enemies, to turn out from the gin a smooth sample without defects, and to establish a reputation for a consistently high quality of cotton The principal advantage which the Fgyphian growers have over those of other parts of the world is that they have absolutely definite standards or grades, which are known all over the world and which can be depended upon by all better world and which can be depended

Having determined upon the enterprise, the tire com-pany, after investigations, decided upon the Salt River desided upon the sain taver valley, in Armona, as the scene of their operations Here elimatic conditions were favorable, an abundant water supply was assured by he great Roosevelt Dam mearby, and a sufficently large soreege was available to insure the estafactory working out of all secondary details. Some of the 35,000 acres sequired had previously been ecoped to alfalfa but a large portion was wingin desert which had to be re-chained. A waker system by, and a sufficiently ed. A water system red to reach every pordanted to ection as fast as thomsacis of workers will be supplyed in the fish when the pictors is recognists. Free gint have been eved to handle she product, and is the interstein of these elegans of the work to tall system specially in the work to tall specially specially the work to tall specially specially the work to tall specially specially the work to tall the sum of the second special special

Using a big tree for a derrick mast

crushed for oil and the by pr ducts fed to stock. It is thought that even the stalks can be utilized in the man

thought that even the stalks car be utshed in the man feature of a substitute for purp pulp. The Salt River Valley priject will be a cooperative one in every way. The company will partially finance local settlers who engage in outon lawing under the preserved conditions and will provide for the marketing of the product. The continued production of a crop with a fixed had quality of here is a big problem and with a fixed had quality of here is a big problem and with a fixed had quality of here is a big problem and the basic. The grown alone connect elect to stabilize too of the cotton, industry in his community. I be ginner must devote his mill eviluavely to the gnining of long-staple varieties, as otherwise pure seed and a un long-staple varieties, as otherwise pure seed and a uniform fiber cannot be maintained. The banker must help ause he must stand ready to lend his money to the producer during the long growing stason. Luthermore each grower must use every effort to keep out of the district the plant diseases and encines so prevalent in ordinary cotton districts

In staple and quality of fiber the American grown cotton is commarable with the best varieties produced in Egypt In both countries the cost of production is about the same, for what the Fgyptian saves in labor cost is made up by the American in the utilization of labor-saving machines | The crop producing capal intreof the land are about the same in each case. A g is production is a balk in sere worth from \$1.0 to \$4.00 of the great difficulties confronting the gr w s f the long-staple cott n in this country is the suit at adequate supply of pure sect. At the present tine the supply is much below the demand at 1 pir es ar higher than at any time in the history of the oft n in

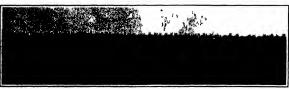

Egyptian cotton in length of stapl between average Sea Island and ever get pland in the ary American) cotton. It has however certain har ter American) cotton. It has nowever certain har for states which cause it to be in lemand ven in the linted states where during recent years Lagitimi cett i has comprised about 80 per cert of all imp retect oftons. These special qualities are its finenses strength clustering and great natural twist which combined coable it to make very him, attrices very a midel to the passifications. make very fine strong yarns suited to the immufacture of the better qualities of hosacry for mixing with silk and wool and for the making of lace. It also increasizes

Climate conditions in Egypt differ radically from those existing in the cotton belt of the United States but closely approximate those obtaining in Arizona and in southern approximate those obtaining infarizons and in southers of califorms. The ramfall in Lygyt is very annual and is quite manfalling the Niel Delin during the growing season yet Egypt stands third in the cotton producing countries of the world. I laborate irragation works supply the cotton fields with the necessity water and this continuous distributions almost displication with laborate irragation works supply the cotton fields with the necessity water and this continuous distributions almost displication the long-staph districts of the Sait River Valley and the Imperial Valley in this Sait River Valley and the Imperial Valley in this section. 1 800 000 acres and nine tenths of it is in the Nile Delta the delta soil is typically a heavy black alluvial clay very fertile but difficult to work. The soil in the cotton districts of Arisona is in many respects similar to that of Lgypt and with climatic conditions irrigation type of soil and other elements needed for successful cotton growing almost identical with those found in Fgypt there is no ruson why the United States should not be able to produce all the long-staple cotton it consumes within its own borders

from the cotton raised the utilization of the by-products obtained from the cotton seed will greatly add to the financial returns of the growers as a variety of valuable products are now obtained from the seed For every pound of cotton produced for the market there are two pounds of cottor seed. Until a few years ago these seeds were considered as worthless and the problem these secon were considered as workness and the phoblem of their disposal was a tring out. In the vicinity of every gan were huge piles of cotton set of left to rot and produce an offenness odor. Some of it was used to frethiz the fields but the great hulk was dumped into streams, burned or otherwase wasted. But this is all changed now. The said is either manufactured into vigitable oils and stock foods or if it is left on the plantations it is entirely utilized as feed for

stock or for fertilizer analysis of ordinary Unland cotton seed shows that it is nich in nitrogen phosphoric acid and potash The Egyptian cotton seed is even more valuable for its them ical constituents. Compared with commercial fertilizers it is estimated a ton of cot-ton seed is worth at least \$10

the best grades of cotton ed oil are used as a substitute for olive oil or lard and the poorer grades are employed in the manufacture of soap candles and phono graph records Recent ex-pertments have shown that flour made from cotton seed when mixed with wheat, makes a pulatable and nu tritious bread (often seed meal or cake to one of the and it has from three to four times more proteins about times as much ash or bone material as corn or oats Even the cotton seed buils which remain after the mill ing process are utilized in feeding stock and in the vicinity of the big mills of the Youth it is customary to find large establishments for the feeding of thousands of head of stock for market

Plewing the fields for cotton to make tires

A field of raung potton on the tire farm in Arisona

The Heavens for January, 1919

A Group of Stars of Extraordinary Proportions

By Professor Henry Norris Russell, Ph.D.

WITH the opening of the new year men of science like all others or gradually settling down to their old pursuits and o copations but it will be several worths before the control of the c months before this return to work is rellected in an increase in the now diminished volume of scientific papers and one who like the writer g to an opportunity to look over the current literature (11) at longer intervals than usual still finds himself surprised at the small amount of new material that comes in month by month

amount of new material that comes in month by month.
This is very much as it should be at the close of this overwhelmingly eventful year. Yet on second thought it is remarkable not how little has been added to astronomical literature but how much. And while this is true of the United States at is still more conspicuously so in I ngland. The number and the high quality of the papers which have been published by the Royal Astropapers which have need published by the rowal astro-nomical Society of I ondon during this fourth year of the war, are truly annuing. In fairness to our defeated fore-we must recognize too that astronomical work of real value and considerable amount has been done in Germany

value and consagrance amount has occa done in Germany during the same intrival (and transmitted to the outside world through the good offices of Danish astronomers) Ewin astronomics of France and Belgium driven from their observatories and their homes by the fury of in-

vasion have (when unable to take up arms in defense of their country) found asylum in Lighand or America and continued to carry on researches of the most excitent quality. But the matter of which we may well speak more particularly this month is the work of a neutral, and probably the most distinguished of all astronomers in neutral countries- Professor Kapteyn of Groningen in Holland

In a series of admirable papers pul-lished in the Astrophysical Journal this master of stellar astronomy has discussed, with great fullness and ingenity the stars of the folium type which are situated in the part of the heavens that includes the constellations of Cams Major michides the constellations of Cams Major and Orion. He has determined their datance, their true brightness and their motions in space. This problem was more difficult in this case than in that of the stars in Centiculus and Scopio which he handled some years ago for this time he had to deal with a group of stars which are moving almost straight away from use and these for assert to be watered as the star of th therefore appear to be standing almost still in the sky

The more obvious methods applicable to a group of stars with casely recognizable proper motion were therefore not at his disposal and it was only by a very ingen ious combination of all the available data that Professor Kapteyn finally reached his goal Complete success has at last crowned his efforts and at the end of his monograph ho gives a table of his results which amounts brightness of each of more than a hundred The bulk of these stars are likely to be of interest mainly to the technic

student but the conclusions regarding the distances and so on of the brighter ones are certainly of general significance and may well be retailed here

Some Startling Figures

The group under consideration includes all the conspicuous stars of Orion except the ruddy Betelguese together with almost all those of Canis Major except Sirius It has long been realized that these stars were remote and very brilliant objects but the actual figures are decidedly impressive. Beginning in the northern part of Orion, and picking out the bright stars, we find that Gruma Orionis (in the grant's shoulder, as he is that critima Orionis (in the famile shoulder, as he is depicted on the old star map. is at a distance of 370 light years and gives out about 2 100 times as much light as the Sun.—I he neighboring star I simbda Orionis in further off (\$50 light years) and though not very conspicuous to the eye is in reality 500 times brighter

The three stars of the belt are still more distant Into three stars of the bort are Mill more unstant. With many others in the vicinity, they belong to an unmistakable cluster of very white and hot stars which conters itself upon the Grant Nebula of Orion, and is therefore called by Kaptevn the "Nebula Group." The average distance of the group, and doubtless of the

Nebula itself is 600 light years. Even those stars of the cluster which appear faint to the naked eye are great suns. Thur bigma Orionis (close to Zeta and below it) is 800 times as bright as the Sun. Eta Orionis (below and to the times as bright as the bulk 21s Orionis (between and to take (left of Delta), gives out 1,000 times the Sun's light, and lota Orionis, just below the Nebulis, is 2,200 times as bright as the Sun. The three stars of the belt are brighter still, Delta being 3,000 times the Sun's luminosity, Zuta nearly 4,000, and Epsilon, the middle one of the three, reaching the prodigious brilliancy of 6,000 times that of the Sun

Kappa Orionis, in the lower part of the constellation, is 520 light years away, and 2,000 times as bright as the Sun Beta Cams Majoris, which to the eye seems so small compared with its neighbor Sirius, is 450 light years -more than 50 times the distance of Sirius 2,400 times as bright as the Sun, or 100 times more luminous than Sirius, which owes its preëminence in our skies purely to the accident of proximity

same purroy to the accident of proximity
There are several very pright stars in the group below
Sirius, the brightest, Epsilon Canis Majoris, being
nearly 600 light years away and 5,600 times as bright
as the Sun
But the leader of all this starry host is
Rigel, which just as it appears brightest to us, is so in

At 9 o clock Feb 6 At 8% o clock Feb 14 At 10 o clock Jan 7 At 10 o clock Jan 14 At 10 o clock Jan 29

At 914 o'clock Jan 29 NIGHT SKY: JANUARY AND FEBRUARY

reality The estimated distance of this enormous star is 420 hight years, and the resulting figure for its immossity is 1,000 times the brightness of the Sun Iha makes it by far the brightness star of which we have definite knowledge—Epsilon Oronis and Epsilon Canis Majoris coming next, and then Antares, which is about 5,500 times a brightness that in the heaven, but to say that Rigel is the brightness star in the heaven, but in the say that Rigel is the brightness star in the heaven, but

Simply when the origin are too suit. By inawes out one many only that it has not yet been possible to determine the distance, and hence the brightness, of any brighter star. Alpha Cygin may be as bright, or brighter, and it is rather probable that Canopus is brighter still, while some of the Cepheid variables of unswaight long perod, seconding to Singley's work, may also belong in this class. Singley's work, may also belong in this class. Singley's work, may also belong in this class. Singley are considered to the control of the control of

The physical conditions which prevail in such a re-markable object encourage lively speculation. From the spectrum of the star, which is of the type called B8, and indicates a surface temperature a little higher than that of Sirus, but not nearly as hot as the stars in the belt—from this it may be estimated that Rigid gives out brehaps 20 times as much light par square into as does the Sun. If this is true its surface must be some 600 times as great as that of the Sun, and its diameter about 25 times that of the Sun, or a little more than twantly million miles. This would make it bulk about 16,000 times as large as the Sun. What its meas may be we can only roughly juese, but according to the latest investi-gations, its great brightness would undoate an unusually great mass. One hindred times the Sun s mass might not be an unreasonable figure. This would make its times the departy of ordinary as: belt-from this it may be estimated that Rigel gives out times the density of ordinary air

Though these figures are professedly little more than

Though these figures are professedly little more than guesses, they probably give a fair ides of the nature of this amazing object—a huge ball of gas, fairly dones at the center, but highly rarefield at the edge, and furnously incandescent, even to its very outer limit, to a degree which we can hardly conceive. In front of such a star, and viewed by eyes capable of bearing its brightness, our Yun, so dassing to us, would appear like a small black spot

The Heavens

Orion, with the glorious stars of which

Ornon, with the glorious stars of which we have just spoken, a mor full south, high in the heavens, and dasplayed in has full effugence. Cama Major is below, with Siruss apparently far outshaming the vaster. Cama Miner is on the left of Ornon, and Cennin is above. Lee is well up in the East—Satur being close to his brightest star, Regulus, so that the two look to the naked eye almost like a double star—and Hydra nees in the southeast. Uras Major Livas Minor are below the Pole, water than the cephing and Cassiopera are descending in the northwest. the northwest

the northwest
Pegasus has just set, but Andromeda
and Aries are still well up in the west
Persons is higher, then Auriga, right over head Taurus is very high in the south-west, with Eridanus and Cotus below

The Planets

Mercury is a morning star all through snuary, but is best visible in the early Mercury is a morning hear as through January, but is best visible in the early part of the month, about the time of his greatest elongation, which occurs on the 7th, when he rises about 540 A M Though 23 degrees from the Sun, he is all most as far south of the equator, and as consequently ill-placed for our observation

consequency in-placed for our observation.

Venus is an evening star, and is slowly coming into view in the twilight. By the end of the month she sets at 6 30 P. M., and is conspicuous just after dark.

Mars is complexious just after dark
Mars is an evening star in Capricornus
and Aquarus, setting at 7 P M, in the
middle of the month He appears as a reddish star of the
second magnitude, and is brighter than any fixed star in

Jupiter is in Gemini, and is visible all night long, being

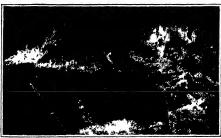

Jupiter is in Gemmi, and is visible all night long, being no opposition to the Bun on the might of January ist. Re is a splendid object, twice as bright as Sirius Saturn is in Leo and rises at about 8.40 P M at the beginning of the month. At this time he is about 2.40 edgrees northwest of the bright star Requius, which he much surpasses in brilliancy. During the month he much surpasses in brilliancy. During the month he moves about 1.14 degrees farther west, and by its close he rises at 6.30 P M.

Uranus as nevening star. On the 22d he was a second of the contract of

he mess at 0 30 P. M. Uranus as a evening star. On the 22d, he is in conjunction with Mars, being 22 degrees north of the latter Neptune is in Cancer, and comes to opposition on the 28th, but is observable only with telescoper and The Moon in new at 0.4 M on the 2d, in her first quarter at 6 A M. on the 9th, full at 4 A M. on the 18th, in her inst quarter at 1 P. M on the 23d, and new again at 6 P M on the 31st. 8 he is nearest the Earth on the 11th, and farthest sway on the 23d. She masses near Venus on the 2d, Mars on the 4th, Ulmanis on the 5th, in planties on the 18th, Neptune on the 18th, Seturn on the 18th, and Marcury on the 30th.

A skeleton from the fossil mine

The tar pit in which (alifornia's extinct fauna is recorded

California's Fossil Mine

CALIFORNIA is indeed a land of wonders and Not the least of its sights though by extremes Not the least of its sights though by no means the best known is the asphaltum bid are miles west of the heart of Los Angeles where for count unesses of the same that the same that the same have been preserved the bones of thousands of animals, most of them prehistoric in their origin Various names have been given to these beds—the la Brea Beds, the Fossil Gardens the Hancock Brea Deposits the Dash Trap, the Pit the Bone India and have a desembled. half a dozen others

half a dosen others

The deposits are by no means of recent discovery
they have in fact been known for over a centur. The
seriest record found a that of the Mission failtness who
writing in 1700, stake that the tare most for while the
settlers of the region imployed it for rooting for fuel
and for paving and in Los Angeles the roots of some of
the first adobe houses were covered with the asphaltum
brought from La Brea springs. At various times during
this period boness were reported to have been found but
it was supposed that these were only those of the racols
tilt agreed bones were reported to have been found but
it was supposed that these were only those of the racols
that the first deposition in 1867s.

animals, in fact this was the opinion of no less an authority than the State Goologiu in 1805.

When the holders of the trile under the original Spanial grants sold the property to American interests it is interesting to learn that the curous little tar springs appearing at various places on the ranch were considered. injurious to the property. It was not then dreamed that the whole region was rich in petroleum or that sourcely a mile to the north were to be located some of

searcely a mile to the north wert to be located some of the richest of prospects of all time. After the Civil Was the demand for tar row and soon carloads were dug from these beds and sold but so many bones were found mixed with the tar that the market for it cased. The big hole laft by the digging soon filled with water and tar and oil and a lake was formed Gas bubbles can always be seen breaking on the sur face of this lake

As early as 1875 the deposits were recognised as prehistoric, and a selection of bones identified as those of an extinct species of tiger. But it was not until 1908 that the work of excavation began. In June of that year Mrs. Erskine M. Ross, then owner of the ranch gave the Southern California Academy of Sciences the privilege of axcavating fossils. From that time on, several schools and scientific foundations were accorded similar privileges for a certain number of months. Many of the fossils were placed in the museum at Exposition Park 11 Los

where they are on public exhi-

Angeles where they are on public exhibition. This bones as ding out are invariably in an excellent state of preservation, the oil having penetrated them thoroughly. The animals that fell victims to this perpetual, silent death trap represent all geologic ages from the Pleucene down to the present time, the trapping of unwary animals is in fact going on all the time. The best authorities tell in a ther, the The bost authorities tell us that the tragedies took place somewhat after this tragedie (ashion

outpourings of the tar springs often formed pools or even streams which, as the dust and gravel carried by the prevailing dust and gravel carried by the prevaling west winds estied and became mixed with the tar, acquired all the appearance of a hard surface. Booser or facter ram would fall and collect on the top. It was then that the unwary slephant or saber-tooth signs or other or bird, seeing the water, came to drink. Not such the viction tried to leave the mirry pool did be choover him-edly to be sure the mirry pool did be choover him-edly to be surgest. The nove he than

struggled the more firmly and ald I he become until finally he was unable longer to move. In a short time he sank deeper and deeper in the soft tar until after a few days he was completely lest to sight. As this profew days he was completely list to sight. As this process has gone on for ages macy animals of every concewable description—be arts of all sales tools tigers elephants the giant shoth his process and a host of best and a maller content. elephanic the kinds atom into a pictoria and a host of birds and smaller quadruptic—cane to be incleded here almost in a solid mass of birds. As fate as the 80s colls were known to have been thus loat in the internal skunks and birds are trapped their today. In fact the pits may be said to constitute a natural mausolium

Stealing the perfume from a dish of flowers

in which is preserved a long and graphic record of the animals that have inhabited bouthern California through past age of geolgic time. So nearly do the fossils found here represent some of

the present-day African and Vantu spaces that some scientists are inclined to accept their if not as proof at least as evidence that thes continents were at one time connected with the An accan continent. Be that as it may the beds and the firstly in the mill always be of prime interest to the student of natural history paleontology or geology and s f r is cut now be s co there exists here an inexhaustille storehouse of relee of

The litted whose expe are worth more than those of the hen

Simple Perfume Making

FI W people know how easy it is to capture the frag T rance of real flowers. The first step in the plan is to secure a glass femael. The small end of this instead of opening should be drawn out to a fine point means must be adopted to maintain the funnel in an unright position. A little stand made of wooden uprights and wire is shown in the photograph. Any kinds of highly scented flowers such as 108es may be gathered. these should be in fresh condition as just after opening, the fragrance is at its best. Place these in a vase filled with water so that they will not wither. Now get some ice and crush this puto small fragments using it to fill up the glass funnel At the same time place some recep-tack under the funnel Sprinkle salt on the ice and then

anove the flowers and the funnel onto close proximity

After a while it will be seen that the musture from the
atmosphere is condensed on the outside of the funnel the
surface of which is chilled by the ic. The othereal odor surface of which is child by the rec. The otherest odor of the flowers combines with this liquid which slowly trakles down by drops into the receptacle. When a sufferent quantity is secured this may be mixed with about an equal quantity of pure alcohol. The maxture should then be placed in bottles when it will keep for an indefinite time. It this way all kinds of flower perfume may be captured with the greatest case

The Water Monitor

THE Water Mointer Varanus salester is one of the standbys of the oticens of India Ceylon and the Malay Pennsula and Islands and thereby hangs a tale You might shidder when you suddenly confronted one in the jungle. Not so the native hunting its eggs and rejoicing to get near such treasures. The Monitor is notes unite and so the native number is eggs and reporting to get non-so is to the native number of complete with a long finked tongue extending from a sheath like a snake. It is one of the largest of existing ligards reaching a length of 7 feet although its marrest relative the gigantic Australian Monitor grows from 12 to 30 feet long. The Monitor lays twenty or more relative the gigantic Austrainan automor grows from to 30 feet long. The Montor lays twenty or more white soft shelled eggs in hollow trees and in Barma these bring a much higher price than hen sogge. The Monton is well fitted for its life. It is a swift.

runner able to overtake the specifiest mammals frogs turtles and snakes on which it feeds. It often startles hunter six reading through the jungle making as much none as large game. It chinds trees for squirrels birds and that e.g.s. At other times it may be found digging along stream larks for the eggs of the crossodile of which

it is nost fond. I other in ranging or swimming it can leave its cutmics far behind. If surprised when up a tree it drops into the water, swimming with pe werful strokes of its flat-tened tail which acts as oars and rudder When being, captured it fights with teeth, claws and tail

The natives term the Monitor Kabara-Although it is harmless and non Goys Although it is narmiess and non-poisonous it is used to produce deadly poisons. The Sinhalese are experts in brewing a deadly poison termed. Asbara-tel. They extract poisons from venemous snakes adding arsens and other drugs, and her the Monitor comes in as a part of their superstition. They tan three monitors on three sides facing the fire I hen they torment the Monitors with whips and make them hiss to cause the fire to blaze up You and I would take a believe that the hiss of the Monitors adds to the poisonous quality of the deadly

Inventions New and Interesting

A Department Devoted to Proneer Work in the Arts

Adjustable (utter for Making Large Holes in Metal

Till tim required tocat a hole 11, to anches the left are or steer plate is fallammer I II hisel In official cuttrast is the use of a pully designed cutter which its maker say

For a quick hole in a sheet of metal

can do the same task in five minutes a can do the same task in two initiates a most valuable saving of a workman a time like cutter is small and casily transported for work away from the shop and is adaptable not only for the metals other metals slate maniating fiber asbestos board linoleum auto bodies boilers tanks and cabinets

The cutter is adjustable for making holes of various sizes All that is neces sary is to drill a 3 f-inch pilot hole through the material through which the stud of the cutter is passed and held in position by a flange nut. A few operations of the ratchet wrench quickly moves the cutting tool around the circumference of a circle of the desired diameter and a nest hole results in a few minutes

Device for Handling Hot Metal

AN American company has recently perfected a unique inquid metal car for use in charging large steel furnaces with hot blast furna c motal. In the modern processes of making steel it is now customary in the largest plants to put hot metal in open hearth furnaces together with cold scrap steel and melt the two down and refine them into steel It is not easy to transfer this hot metal into an open hearth furnace but this new device renders the operation much

It consists of a short pour ladic with the necessary tilting mechanism and the necessary titting mechanism and a motor-diven charging spout mounted on an all steel frame. The capacity of the ladle shown is 35 tons but it can of course be built

to carry any desired capacity
After the ladle car receives its load
of liquid metal from the mixer blast of liquid metal from the mixer blast furnace or a larger ladle it is taken to the charging floor of the open hearth plant by a loromotive or most reduven truck and run on a track directly in front of the furnace The motor-driven charging spout is ladle tilted the power for this being supplied by a motor and train of gears driving the drum which takes ing bar connecting with the tilting lug of the ladle

Short-pour stands mounted on the car frame enable the ladle to rotate maintaining the axis of the pour on a line with the pouring spout of the ladle. In this way, it is pointed out the pouring quart is kept close to the reacting range during the whole pouring μ it too thus centuing the metal to a shut Irop into the trough while the p rtable charging spout and ladle crane

A Simple and Efficient Pyrometer

N the early days of the war in England, so great was the demand for steel and men and women had in many cases note and women had in many cases to be used in foundry operations which ould be done successfully and accurately only by the use of pyrometers So complicated are many of these material ments and so difficult to make in a hurry that it was found necessary to devise a that would meet all the cocutial conditions Recognizing these facts two Englishmen W.R. Barchev and G. I. M. Stone worked out an instrument of decidedly novel design to meet the reourcus nts

The apparatus onsists essentially of The apparatus onesists essentially or an outer tube of fused side a closed at its lower end and open above. Inside this tube is a rod the lower portion of which is made of fused silica and the upper portion of metal. The top of this rod is pivotally connected to a point r having

at a scal beyond that to fit into

the lower end of the tube, but with the necessary allowance for expansion is a small piece of fusible metal of the same alloy as the metal for which the apparatus is to be used but w constituents proportioned so the

Drilling Upside Down

Whills not an absolute innovation the design of
the drill pictured herewith,
which drills upward natead of
downward is at least to be
recognized as daring if it
were simply one of those things
that will work and for which
no more positive claim than this
could be made at would be incould be made it would be in-teresting but such is far from being the case, and it therefore acquires added interest from the numerous advantages which its manufacturers bring forward

as the main features of their epositest edge of the tube and terminating It was designed, in the first place, is a practical metal worker, for the purpo of chewing up tons of old castings in h

Selden Trucks

1877-1919

The first gasoline motor propelled road wagon was a SELDEN.

The present types of SELDEN TRUCKS are the result of years of continuous experiment, observation and experience in manufacture since the day of their inception in 1877.

One to Five Ton Models. Write for full information.

SELDEN TRUCK SALES COMPANY

ROCHESTER, N. Y., U. S. A.

No Leaky Roofs for Ten Years

Coat your roofs old or new with Stormking and they are covered by our ten year guarantee

Come rain or snow heat or cold the water proof oils and gums and the asbestos fibre of Stormking will remain steadfastly water-tight

Easy to Put On

Apply it in any weather on any roof surface—tin, wood tile, stone brick slate concrete, canvas, composition etc

For your convenience Stormking is furnished in plastic form to be applied with a trowel or liquid to be brushed on

Plastic Stormking is especially recommended for repairs to leaky joints breaks flashings and over shingles where extra body is required

Stormking saves labor and material expense Investigate

A Simple and Efficient Pyrometer (Continued from page 18)

melting point corresponds to the tempera-

with a special covering to resist the cutting in its allow the rod to descend, by gravity until In so descending it raises the pointer in the quadrant to the position shown in the dotted lines, thus indicating in a positive for pouring The pyrometer is then withdrawn from the crucible and in order to prevent its metal charge fro solidifying round the rod the outer end of soliditying round the rod the outer ond of the pointer is depressed until it is forced by a spring catch into a recess in the bridge-piect hitting the rod clear of the metal When the latter has set it is merely necessary to release the pointer the apparatus is again ready for

It may be noted that a special socket connection has been devised to join the metal and the silica portions of the rod in order to prevent the latter from becoming separated when the metal socket expands with the high temperature. The connection consists of a socket having a number of slanting sew cuts formed in the sides. The silica rod is fitted into the contral recess and rammed in with comen the arrangement being such that the saw cuts allow for expansion without relaxing the hold on the succa rod In the event of an accident, such as the bottom of the tube falling out while in the crucible, the charge is not spoiled as the fusible metal being the same class of alloy as the charge does not have any deleterious effect on it

m Farm Trademarks that Bring Business

ALWAYS a trademark is worth having, and when it is catchy and particularly appropriate for the products sold it is of especial value. To this remark the business of agricultural production affords no exception An eastern farin famous for its poultry and which has extensive apple or hards adopted an attractive distinctive name that combined these two products in a single coined word which was illustrated cartoonwise by an appropriate design. This mark in varied sizes is employed wherever opportunity permits on letterheads en volopes billheads selling literature carton It is a striking thing that is seldom forgotten by those who see it long ago

Progressive farmers who long ago realized the value of a good farm name are now adopting trademarks freely where the farm advertises or sells direct to the consumer by parcel post the money making possibilitie of the device are making possibilities of the device are so great that puns should be taken with it () med names like that alluded to have particular value for while a poorly coined name simply sounds silly, a good one has enormous pulling power and it offers the additional advantage that it can be registered in Washington and ownership and sole right of use thus guaranteed The head of one of the great biscuit comtween the and of the nuner section and the land sole right of use thus guaranteed intersection of the outer rails. Thes, The had of one of th great busult cominserted rails are marked in the diagram pantees a ward to have appraised the content and the three a line of contractions. The dear of the device as to provide at train on either line, as familiar with animally advertised at the approach of a train on either line, as which only the origination and advertising as done purpose there is a ling or filler at each of the contraction of the second stake. For this use

f the registry privilege, the cost of which is so trifling Sometimes deplorable con-sequences arise

In any event, there is a base casting, exponents the rails rest. On each side of this, a few makes from the bottom, is a like eads of each shaft are found the lugs or make the eads of each shaft are found the lugs or make the first system all the lugs are stock and has fared, able there is a full rail in each direction, all the time. Getting Down to Business

Today American Business faces an era of stupendous possibilities. We are shout or enter an age of industrial prose the war has tapped cannot be sealed up. They are known open and flowing and must continue to flow for the basels of all mankind. This is an obligation arising from the unquestioned Leadership in Finance Transport stems Industry and Agriculture which this fortunesed was have thrust upon America.

O every thinking man the future must be interpreted largely in terms of motor transportation

New industries born of war's necessity must continue to serve in peace. They will need motor trucks

The enlarged capacity of America's factories none too great to meet our own and the world's requirements must rely upon modern haulage

Our standardized fabricated ships are needed to carry America s goods to foreign lands Their cargoes must go down to the sea in motor trucks

The multiplied harvests of our power operated farms can best be carried to market with motor trucks aiding rail road and ship

Our soil is still rich with coal ores and petroleum. Better roads and more trucks are needed to release them We accept Federal s part in this great constructive peace period not only as an opportunity but as a duty

That manufacturer falls short who sees in a motor truck only a power vehicle to be sold at a profit

He must sense his larger obligation to supply haulage units that will assist in the fulfillment of America's great in dustrial destiny

ROM thevery beginning of its history Federal has laid solid foundations

Federal significations a mere combination of specifications but perform ance quality of service—the assurance of haulage reliable efficient and economical

What Federal signified before the war Federals have proved many times over in their war time record That record is the ample evidence of what may be expected of Federal in the coming period of business expansion

Federal plans for the future are plans for growth in order to answer every haulage need for more trucks and the right kind of trucks

The Federal Haulage Research De partment will be developed still further so as to offer motor truck users inform ation that will enable them to get the utmost of service from their trucks

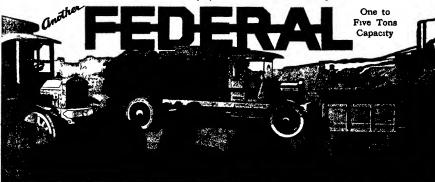

This is the purpose that animates the entire Federal organization as we are once more 'getting down to business'

If in the following out of this purpose, Federal can help you in your business, you may rest assured that no details will be overlooked in our endeavor to serve you well

For the benefit of motor truck users present and prospective Federal publishes regularly an attenst in worth while imagazine. Federal Traffic News which discusses actual problem so I haulade in various specific lines of business and shows how they have bean solved. It contains a wealth of suggestion on motor transportation for the owner and operator of a tuck. We will be pleased to send it to business executives on request

Ratiroad Ferry Service Between England and France

ONE of the carefully-guarded secrets of the war was the construction at Ruchborough, on the south coast of England of a large fright yard and railway ter-minal ferry for the transfer of loaded trains between England and France So well was the location concealed that this important link in the cross-C hannel com munications was never sub-jected to bembardment by

jected to bembardment by airplanes or Zeppelins. The terminal which is known as Ruchborough is lossted near the coastal town of Sandwich, and was built upon land which, three winters ago, was a favorite resort of the coot and the heron, and was used, in part, or the pasturing of sheep

for the pasturing of aheop One.

The site selected included about 2,200 areas, and in addition to a large railway storage and classification yard with the usual tracks and storage yard with the usual tracks and storage buildings, there was constructed an ex-tensive plant for the construction of barges. The magnitude of the Rich-borough terminal works may be judged from the fact that at the close of the war its personnel included 20,000 officers and

For the train ferry service three steel terries were constructed of the type shown in our illustration. These vessels are 33d feet long by 61 feet in beam with 10 feet of draft, and their speed is 12 knots. Their displacement is 3,055 tons and they are draven by twin screws. They are provided with four railroad tracks running the length of the shap whole have expanded on commodate the rise and fall of the tules movable ferry slaps were provided at each terminal. The trains were run directly on the ferry and at the terminals at France were hauled ashore and taken directly on the ferry and at the terminals at France were hauled ashore and taken directly on the ferry and the terminals at France were hauled ashore and taken directly as the same to be shown in the ferries were not loaded with freight transfer to the significant of the ferry that the training supplies for the fighting front. The service was started in full same on the lat of February, 1917, and from that time to the signing of the armatine, it had carried serves 1,285,000 tons, gua shelit into the signing of the armatine, it had carried serves 1,285,000 tons, guar and the state of the fighthey are plant. A large number of barges were shortened here and, in canasculou with the farry service, a total of 233 steel barges and 500 tags were in community opening the order of Perses, which enclosed digit into the fighting fraction. ferries were constructed of the type shown in our illustration. These vessels are 363

One of the railroad ferry-boats, built for cross-Channel war service Carries 54 cars at 12 knots

The ferry-alip at Bickborough being lowered to level of ferry deck

and ferry leaded with

It should be mentioned that each of the ferry boats carried four anti-submarine guns of three inch caliber two mounted at each end of the boat In addition to other terminal on the English side of the Channel at South ampton lerries from Rich borough ran to Calais and Dunkirk and the service from Southhampton ran to Dieppe

The Effect of Altitude on the Eye

ACAREFUL study of the effect of altitude on the eye was made at the Re eye was made at the Re search Laboratory at Mine ola, L I in order that the complex practical problems could be more scientifically dealt with according to (apt

the convergence of the power to build, deeph and
the fixed to be the convergence of the power to build, deeph
and the fixed to be the power to build, deeph and stereopsis (the power to judge depth and distance) all showed weakening due to the

datamic) all showed weakening due to the effect of altitude the changes occurring at varying altitudes in different subjects Should goggles be worst. In our opin ion continues (apt Berens they undoubtedly should be worn if a properly constructed and ventilated goggle with a perfect hild of vision and gord optical glass can be obtained. Goggles art a great protection in the wind as their use prevents tearing and inflammation of the hids and also prevents hot water or oil from striking

It is also important that there should be not too large a bar between the eyes as this may interfere with the use of both eyes in the judging of distance Colored lenses are a great help but it is better to wear them only when absolutely necessary as when flying toward the sun in a fog above the water or in the case of pilots whose colored knses are worn one should always have a pure of goggies with white lenses ready for instant us. Friplex goggies are some protection although chips of glasse fly off the posterior surface and the rensiting material placed between the two glass surfaces deteriorates with age and becomes less transparent

If a man is flying every day without the If a man is fiving every day without the artificial use of oxygen is should have his eyes examined every month, as the ocular condition is also an index of general physical fitness. It is important to have an immediate ocular examination if the aviator is landing badly having trouble in seeing clearly or in judging distance, for a few days' treatment may be the invarian of preventing the wrecking of a plane or a more serious secident

New York Subways Must Be Readjusted

"HI new system of subways including two fundamental lines extending north and south through Manhattan and the Bronx om on the West Side and the other on the Fast Side with a system of shuttle trains supposed to connect the two at 42d Street, has been in operation for a sufficient length of time for the traveling public to form an estimate of its convenience and efficiency

We feel confident that we are voicing the practically unanimous opinion of the people of New York in which we heartily concur when we state that the present arrangements are exceedingly inconvenient

A passenger coming down from the upper West Side who wishes to cross over to the lower I ast Side line or vice-versa has to alight from the train at Times Square follow a long and confusing course through the station to the shuttle tenue and on arriving at the old (craud Central Station he has to climb the stairs and take another long walk before he can get into touch with the East Side line. Even to the passenger who has made the trip and is familiar with it the delay and the con gested crowds are from a business point of view a nussance and incur a very considerable loss of time In other words a truly magnificent system of rapid transit is delayed interrupted and to any but regular users, that is to say to many many thousands of visitors to the city is rendered extremely confusing

In considering this problem we must not be unjust it cannot be denied that in the neighborhood of 42d btreet there is a great congestion of underground lines and beyond question the Public Service Com mission and its engineers had a very difficult problem to work out at this point. But seeing that they had determined upon a shuttle service they should have made it a sine qua non that the shuttle-train tracks at each end of 42d Street terminate alongside the platforms upon which the cross-over passengers are discharged

Something must be done to restore the system to its full efficiency. The obvious plan is to build another connecting subway through one of the cross-town streets in the neighborhood of 42d Street using the present 42d Street line for the trains which convey passenger from the upper West Side to the lower Fast Side and using the other cross town subway for traffic from the upper East Side to the lower West Side Such an ar rangement would restore all the greatly appreciated advantages of the old system and would avoid the present troublesome break in the journey

HEN war was declared the technical men of this country who were unable to men of front demanded some means whereby they could share in the prosecution of our cause l his feeling resulted in the organisation of the War Com-mittee of Lechnical Societies. The functions of this tody were to assist in bringing the engineering resources of the country to bear upon the technical problems of

The Committee was organised by joint action of the leading technical societies. The appropriations from these societies were too small to support efficient work so the Committee accepted an offer from the Navai Consulting Board by which it agreed to cooperate with the Board in return for offices, tell ubone service, and postal privileges

the first fruits of this admirable arrangement wer omt bullctins of the Board and the Committee on The Firmy Submarine and Problems of Airplane improvement. These bulletins placed before the Improvement engineers of the country in concrete form the funda mentals of these two important fields of war invention They told what had been done what had been tried without success what was wanted they risulted in a much improved class of suggestions over what the Board theretofore been receiving

But it was not contemplated that the engineering problems of the war be dealt with entirely by voluntary offerings of the pulls. During the prosecution of hostilities new problems of all kinds were constantly coming up both in the army and in the navy These were problems which the army and navy engineers by of their very specialization were not qualified to atta k to best advantage and on the other hand there seemed no effective agency to exist whereby such publicms might be referred to the men equipped to solve them It appeared therefore that the War Committee with its technical affiliations could meet a very real need by acting as a go between to bring the problems of the army and the navy officially before the anguerra and techniques best qualified to deal with them

At first there was a hitch in this arrangement There was no go between to bring the problems of the army and the navy before the Committee and the latter found it difficult to get hold of these problems at long range This situation was met by quartering the Committee with the navy and by appointing in the army a liaison officer part of whose business was the keeping open of communication between the Committee and military chiefs

All this turned out admirably The problems of army and navy began to get properly before the Committee in all their bearings, and the Committee was invariably able to analyse them sufficiently to refer them to just the right place for solution Some were suitable for general distribution to all members of the engineering community through bulletins and letters some of a some confidential nature went only to selected individuals who were known to be interested in the class of work in volved and a certain few secret to the last degree required the higest order of technical qualifications to be found only in earefully selected scientists and inven tors whose whole life-work had fitted them for the investigation in hand Its success in the handling of these ast cases alone would have been sufficient justification for the life of the Committee

Of course the Committee did not operate without friction It had to learn how to discharge its functions by discharging them and learning from its mistakes made plenty of these but seldom or never the same one And it was just getting into its stride, and bringing the whole weight of our technical mansquarely into the fight, when the bottom fell out of the war and left the Committee without a job

This little notice is in fact an obstuary On December 31st the War Committee of Technical Societies ceased to exist. It had done its work well it was responsible even more than can be adequately realised from so close by for the thoroughgoing participation in the war of American invention and engineering. And though its members may have feelings of regret that what must appeal to them as the untimely collapse of the foe should have robbed them of the satisfaction to be derived from witnessing the full fruition of their labors, the Committee at least goes out of business with the satisfaction of having done all that was asked of it-and a little more

Getting Rid of German Shackles

N the floud of lamentable nonsense that has been let loose of late in the American press on the subject of German science and German scientific literature A. of German scence and German scenario chusetts Institute of Technology Writing in Session on the subject of Insidious Scientific Control, Professor Wilson hits the nail squarely on the head when

he undertakes to point out just in what way the scientific literature of Germany as superior to that of other countries and the direction in which the rest of the scientific world must bend its efforts if it would secure freedom from (erman intellectual shackles

So far us the public at large is concerned, the issue has been deplorably confused by resterated statements to the effect that Germany has never surpassed, or perhaps has never equaled certain other countries in the task of adding to the world a stocks of valuable knowledge In the field of creative science, we are told, German grant this contention with alacrity What then?

The policeman on his beat the cab-driver on his

box and the provinceal politician on his stump may be pardoned for believing that a nation which is not prolific in scientists of the first rank is not capable of turning out particularly valuable scientific textbooks and refer ence books Nobody who uses such books however, should fall a prey to this fallacy The best didactive scientific books are almost never written by the leaders in scientific thought and the pioneers in scientific investigation They are written by persons who have a talent for exposition and unflagging industry in assembling knowledge wherever available, and who, as often as not, have never made a single scientific discovery

Just how have German publications acquired their undenuable held upon the minds of well-educated scientific workers throughout the world? It is idle to talk of propaganda The modern business man is well aware of the narrow limitations of advertising that does not rest upon merit in the goods advertised and propaganda is merely another name for advertising

Professor Wilson has supplied a partial answer to the feregoing question. It is found in the everyday law of competition He says

The fact is that any scientist must have the means himself readily to look up the literature on any scientific subject and the fact is that the great compendiums of science the great yearly reviews of scientific progress, are made by Germans and published in the German language It is impossible for a mathematician to work to advantage without being able to consult the Jahrbuch für Mathematik It is impossible for physicists to work without consulting the Fortschritte der Physik Science Abstracts are not sufficient And so it is in many other fields of science

Every cosmopolitan scientific mail will be able to make nany additions to this list | The Minerva Jahrbuch is the one and only first-rate international directory of scientists and scholars. The Geographen Kulender is indispensable within the field of geography and contiguous sciences No British of French atlas approaches Stieler's in workmanship and accuracy But the list m endless

The business of making scientific discoveries is one thing, the business of recording them summarising them. rendering knowledge of them available is quite another In this latter field Germany has had no serious rival and at the present writing no other nation mansfests any sersous intention of taking her place

The workings of competition will not long be hampered by sentimental considerations Unless non-Germans can produce as good dyes and drugs, textbooks and reference books, as those made in Germany, we shall inevitably lapse into economic and intellectual subjection to the Germans It will not help the situation to harp upon irrelevancies

German monopolies have not been good for the world at large nor, indeed, for Germany herself Her commercial monopolies have been shattered by the war Whether they can ever be reastablished is problematical The particular kinds of intellectual monopoly of which we are writing can only be said to be in abeyance hear that British and American manufacturers have solved the dye problem and the glass problem. We do not hear that any publisher has produced an American equivalent of Stieler a Hand-Atlas 'or a British equivalent of Winkelmann's "Handbuch"

These are excellent reasons why books indispensable to students and scholars should be printed in English rather then in German

Electricity

Why Not Larger Trolley Wheels?—In the Electric Reliesy Journal some account as given of the experience of the Oakland, Antoch and Eastern Railway with 10moh trolley-wheels Formerly 8-inch wheels were used the trolley pole tenson being 35 to 40 pounds, and the life under these circumstances was only about 900 miles By using 10-inch wheels the tension can be reduced to 25 to 30 pounds and a life of 0,000 miles or more is obtained. In addition, various incidental maintenance troubles are disminished

Naval Control of Wireless—The Navy Department has purchased all of the radio stations except four high-power stations of the Marconi Wireless Telegraph (Company of America, The stations sold by the company are 45 in number of which 10 are on the Atlantic and Guif coasts 16 on the Great Lakes and 10 on the Pactific Coast. The Navy Department has purchased from the Atlantic Property Custodian the radio station at Sayville I. I, formerly controlled by German interests and imtended for transatlantic wireless traffic.

Marconi's Improved Radio Transmitter—The apparatus developed by G Marconi for the production of continuous oscillations by overlapping wave trains has proved most effective for long-distance communication at high pose? It has done sava with many of the intreste mechanical and electrical prollems encountered in the construction of radio-frequents afternations and art transmitter systems according to the Exterioid World Moreover it makes an apparatus capable of generating damped oscillations at any spark frequency design.

Dielectric Loss in Condensors—In a contribution to the Zatschrift des Guster Ingeneur and Arch skinn I arense Dr Grunberg describes some tests on glass hard paper and muca condensors at a low frequency with glass the efficiency diminishes with increasing frequency A rise in temperature also causes a marked increase in the Gosses, which increase rather more rapidly than the square of the pressure applied With hard paper a more marked drop in power factor occurs with diminishing frequency than in the case of glass, while with most the contrary effect is noted.

Wind Driven Dynamos - in account was recently given in Jegenore by Mr II C. Vogi of some expenence of the utilisation of vind power for driving dynamos. Ib mills described had sails 100 feet in diameter and an area of 3 840 aquars feet. With a mean wind velouty of 24 feet per second 290 horse-power was obtained. Power is transmitted from the main slaft by a seria of goog wheels with the apokes in tension rope and chain gearing were found not to answer. It means of gearing the speed of the main shaft 121, revolutions per minute as increased to 1500 revolutions per minute for the

Electric Heater for Medicinal Solutions - In warning solutions for modicinal purposes it is often essential that an even temperature be maintained according to Alectrice il World With this end in view an American concern is now making an electric heater which incloses the tubing carrying the solution from the supply to the point of apphenion so that as the solution is needed it is heated to an even temperature By using a light dimming socket in conjunction with the heater it is possible to lower or raise the emperature of the solution by varying the amount of current fed to the heater Connecting plugs and cord are supplied with the heater

Insulator Failures —A power company operating in the State of Georgia has recently changed over all the strain maniators on one of its lines as a means of reducing mathator failures. Operating reports of the company showed that 30 per cent of the insulators wave defective. The cause of the large number of defective maniators was found to be on account of the combined influence of the sitematics, the position of the madiators was dual that design. Unequal expansion and contraction of metal parts, of porealin and centent, played a part in the failure, but the child classes was due to the insulators being installed in a horizontal position, their under under the contraction of the contractio

In Honor of Leonarde de Vinci — Ihe fourth centeary of the death of I connarde de Vinci will be celebrated next year in Italy by the publication of a national edition of his works including material never before published Leonarde was the greatest executifie and mechanical genus of his torie and those executifie and mechanical genus of his torie and those place in all ingress centifies and echinical biraries of the works will doubtless find a place in all ingress centifies and echinical biraries.

Fake Cures for Consumption According to the National Association for the Nuty and Prevention of Tuberculosis no less than \$20,000,000 is invested in the humaness of making and exploiting fake cures for consumption in this country. About \$5,000,000 per annum is spent in advertising these nostrums and the typic facilities of the profit is estimated at \$10,000,000 per annum. This is properly described by the Association as blood money

Sengite -- Under this name which is derived from the initial letters of the words Substitute explosive no glycerine with ite added in imitation of the word dynamite a new explosive is being manufactured in South Africa to inect the grawing shortage of nitroglycerme explosives According to a consular report it has a guncotton base and is similar to tonite except that nitrate of soda is substituted for nitrate of barium. It is found that by this substitution an explosive of approximately the same strength as gelignite can be The new explosive is said to be so insensitive produced to shock that it may be safely hammered with a steel tool If used in mining explosions would not be caused by drilling into unfired holes It has already been thoroughly tested in a number of mines and found satisfactory

Adenaid Clubs -- Under this paine the state hunrd of health of North Carolina in its flealth Bulletin describes a new plan whereby surgical treatment is provided at moderate cost t children suffering with diseased tonsile excessive a len 11 growth and kindred disorders. In the medical inspe tion of schools many cases of this kind are constintly found Simply to notify the parents proves woefilly malequate ewing to the expense of an operation the necessity in many cases of taking the child away from home and a general spirit of mertia. The new scheme which has been tried with much success in vari us parts of the state since 1914 involves engaging the services of an expert operator who visits a particular locality on a day previously announced bringins, complete equipment and a trained nurse and operates in as many as 15 children in the course of the day. A (comorary hispital is installed at a local hotel and local physicians are engaged to look after the patants until they come round properly By this plan the expense to the parents able to pay for the operation is reduced to \$12 50 per child and children of poor parents pay nothing

Fixing the Responsibility for Diphtheria Fatalities -The State I aboratory of Hygicine of North Carolina has recently undertaken the distribution of diphtheria antitoxin practically free of cost to the people of the state. The charge f i a package of antitoxin irrespective of its size whether it contains 1 000 units or 10 000 is 25 cents which is march to cover the value of the accompanying syrings and wrippinge. At the same time the state board of health has adopted the policy of seeking to fix the responsibility in cases f death from this preventable disease. It is proposed at the outset to make a carry il investigation by persons visit of a trained epidemologist in one hundred cases of death from diphtheria in various parts of the state With very few exceptions children die from this disease because antitoxin is not promptly administered in proper amounts Less than two per cent die if thus treated during the first two days. Responsibility for the the fatal cases may be either with (1) parents who delay summoning a physicain when suspicious symptoms present themselves, or with (2) physicians who fail to administer antitoxin promptly to patients and persons exposed to the disease and not shown by the Shick test to be immune, or with (3) the local health officer for failing to see that a supply of antitoxin is at all times available in his vicinity. The state board of health proposes to publish hereafter in its monthly Health Bulleten details of fatal cases and to point out so far as possible, just who was responsible in each case

Industrial Efficiency

A New Dutch Industry A factory has recently been installed in Holland for the manufacture of sacking carpots, and even lime fatheres from plant libres, by occase of a new process. Creat quantities of vegetable fiber is now being accumulated for the purpose.

Hemp Braid Dye. Here I for the malbits of the Japanese to dive. succeedible here I rared which is exported to the I intro States and I ingland for trime ingono women shats has set of mile the vession according to business being done in this articl. However, a report has been received from Jupino the effect that in Japanese chemist has invented a process whereby the dyeing may be done unformly.

Numerous Jobs for Cripples A recent canvage undertaken by officials of the Lord Motor Company plant at Detroit for the purpose of ascortaining how much of the work at that point could be handled by empples revealed the following interesting information John that could be filled by legless men 670 by one legged men 2637 by one-armed men 715 hy totally blind men 10. The time required for cripples to become expert at these piles is estimated for 1743 one day or less for 1 461 one day to one week for 251 one to two weeks for 534 one month to one year for 43 one to About 18 per cent of all the employees at the Ford plant at the present time are said to be cripples or physically substandard | 1 ighty-five per cent of them however are classed as fully efficient workers

I emon Drops for Our Army - When our draft armies first came into truining it was found that the lemon drop was a favorite candy among the men It was found also that most of the commercial lemon drops were made of glucose flavored not with the fruit but with an acid imitation. The military authorities obtained samples of kmon drops from a ractically all the candy makers in the country analysed these chose the best one obtained the formula for its manufacture and distributed orders for a supply of lemon drops to be made according to the accepted recipe Consequently the soldiers are now being supplied with a lemon drop that is made of pure granulated sugar and flavored with an emulsion from the rind of the lemon. This confection has the thirst-quenching quality of good lemonade And it is being used by the soldiers at the rate of 200 000 pounds a month

The Danger of Empty Gasoline Tanks -Seemingly empty gasoline tanks or cans are at all times inorc dangerous than those filled with gasoline Usually the ean will not be entirely emptied and the remaining gasoline will vaporize the vapor will mix with the air in the can and the mixture may easily be explosive When the can is being filled this mixture is forced out by the gasoline and may explode if ignited by a flame or spark near the opening Many engines are built with cavities or inclosed spaces in the crank case base or some other part and these may be full of gasoline When inspecting or making repairs with an VADORS open light men have been severely burned when the light vapors ignited. To guard against such accidents all cavities should be blown out with compressed air or steam If neither is available the cover should be removed, the valors fanned out and a lighted lamp or candle, attached to a stick passed around inside the cavities to burn out any vapors that may remain in the cavities Unless an ample current of air at considerable velocity is passing, gasoline should not be used to clean an engine or other machinery Lven if there is sufficient air to sweep away the vapors as soon as they are given off open lights should always be kept a safe distance and on the intake side so that the vapor cannot be carried to the light

Cibola Revealed

Relics of Coronado's Seven Cities in a New York Museum

By John Walker Harrington

CILNCF and r mance give attest to the Seven Cities of Cibela with Kingdom of Quivara of which the good Frier told while sitting in the baters while the good from the district of the district of the control that the whole and it is used to be sure and the kinghts who faced across the American desert have long amene gone to their fathers as to the great of toronado himself his good sword is routed this many a year. We have a first strict this many a year. We have a first strict the first permanent in the first permanent that the first permanent is a first permanent the surface and the first permanent for the district permanent for the first perma

and yet after all what a name is Cibola with which No v that the Covernment has no more need

conjurt. Now that the constraints has a withholding from practual uses the bronz and steel and glass from which showcases are made the Museum of the Amerian Indian in New York city will be able to hisplay the riches of Chola to the public Scorces of heavy packing cases laden with thom are already waiting in the hisement and perhaps soon we shall have the chance to see the relies of that venerable town stormed in 1540 by the Spanish conjuctors

Wherefore let the archaelogist and the historian rejoice together over this notable nistorian rejoict together over this notatine collection from which they may learn so much and let the layman also be glad that he may see for himself what Don I rancisco de Coronado and his followers got for all their privations and their pains.
The riches of Astecs and the Incas

which came so easily into the treasure chests of Spain filled the adventurers of the early sixteenth century with the belief that all the New World was running over with treasure more precious than the wealth of Ormused and of Ind When it was proposed to explore the realm to the sued with the Spanish court for the privilege and they fought each other in the tribunals The more they quarreled about the lands still unseen the more were they convinced that gold and silver and precious stones could be had for the taking

Under the direction of Viceroy Mendosa you will recall the intrepid Coronado set forth from Compo stella in February 1540 to annex the Province of Cibola and the kingdom of Quivara Strange high sounding and the kingdom of Quivara Strange high sounding names were these—given to what is now the Southwest of these United States They were based on the language of the Indians and gradually so many were the tales which the aborganes had told the Spaniards came to believe all that their awartee decisted concerning the mysterious settli ments beyond the border Irue, they had sent as a secul, the good Friar Marcoa de Nua, who,

Zuni Indian workmen employed in resurrecting the relics of their ances

friar came upon calmer days, and was under the ministra triar cashe upon camer akw, and was under the uniners attent of the kinght of the rasor he undoubtedly fold no more than was aurrounded by walls with guarded gates, where there were goldsamths and alivermiths where the women had golden beads and the mon girdles of gold. and where there were sheep from the fleece of whi

and where there were sheep from the fleece or which were wever garments of pure whit, and where the people slaughtered birds and also had images of iron. The story of the march of Coronado loses none of its interest nor does it dwindle in its importance through the discovery of the document among the Spanish

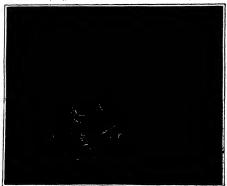

Archives which shows that, five years earlier, Cabe de Vaca had traveled the old Santa Fe trail in the que of the tolden West Coronado will always be asso-tiated as the real pioneer, with these early chapters times as the real pioneer, with turse early chapters of the history of the Southwest for undoubtedly the effects of his expedition the most extensive ever made within the borders of the United States, have been far-

With 300 picked men the most of them cuessed in armor and carrying their great lances in rest, and attended by hundreds of burden bearers, the army It discarded or sent back many of its heavy

trappings and superfluous baggage, and trappings and experiment baggage, and it was reduced to the lightest possible marching order when, in the heat of August, it reached the first city of the quest Indeed, when the natives resisted the design of the when the natives resisted the deesgn of the conquerors to take everything in sight, a sorry and feeble brigade it was which attacked them The invaders were nearly famished The cross-bowmen and the harquebusers were so weak that they could hardly move, and the arms of many of them were out of commussion The mea of Hawikuh, fighting from the house tops of the wall town three bones with such accuracy that they overwhelmed many of the exhausted Spaniards Coronado, a conspicuous target by reason of his shining gilded armor was twice knocked down and would have been killed had he not down and would have been killed had he not been dragged away by one of his andse Fhe natives finally surrendered, however, and the adventurers occupied the town Once in the houses they found abundant food which satisfied thom so well, that for days they were gladder to have had it than silver and gold The town was abandoned entirely by the Indiana, who went to newhorms satisfemants and left.

abandoned entirely by the Indiana, who went to neighboring settlements and left the Spaniards in control to the Spaniards in control on which he had set his beart, Cornando and he and divinous of his party penetrated as far as the present neighborhood of Kannas This was years before Plymouth Rock and Jamestown, and through the first, who afterwards established chains of unissons, critisation was established in what is now the rich and populous American West

populous American West
There is abundant confirmation of all that Corenade Incre is abundant confirmation of all tast Coresaed and his accompanying historians said about Hawkith, which so closely resembles the present pueblo of Zuni Tbs treasure trove of science which the museum has been shie to unearth through the generasity of one of the trustees Mr Harmon W Headricks, tells us truly

A hunter, surrounded in his grave by deer's antiers, traphics of his province, and with the customery broken bewi at his head

all that the cities of Cibola were or hoped to be. Here an test the cute in Choice which still contain the remains of orn such as that from which were made the cakes, which the famished conquistadores said were "the best that ever they did est"

ever they did eat."

The excavations have been for the most part along the slopes of refuse where the dead were bursed. Some of the bodies and been cremented and placed in uras, alongsade of which were the charred grains and foods made roady for the spirits of the dead. Here is a mighty hinter, a Nimred of the Messes, with whom were bursed author of the deser that he had aliam, in the hope that in the Happy Huntung Ground he might still have good score.

Sport The good friar was not wont to complain grievously of his dark gude, Estevanico, who exacted tribute of turquoises, and won the hearts of many native women, And here we have, driven tripit to the skull of one of the feminine eachantresses of old, a comb of wood, encrusted with the blue gen and bearing a band of jet. The wanties which filled that once shapely head are no more, but here in the ruins of the venerable village, we have but here in the runs of the venerable village, we have plenty of proof that the women of the day wors many adornments and were proud of their gaudy garbs. They were found surrounded by their jewels, such as they had, and the vessels of graceful form which they had with them in life. Many of the best examples of pottery were shattered as they were thrown muto the graves—purposely sacrificed or "filled". There are some samples, almost prefect when exhumed, in which are holes in bees and lid to show that they had been offerings to the masses gritted years and the same place of the second place of the s

previous expedition under the auspices of the American Bureau of Lthnology and the Museum of the American Indian. Specimens of baskstry, matting, cloth stones, cord, objects of wood, stone and bone, thousands in all, contribute to our knowledge of the ancient city and its

It is believed that some of the remains are those of Indians who preceded the people who lived there when Coronado came in quest of plunder. That is a matter over which the archaeologists may study for many a day over which the archaeologists may study for many a day to come by comparing and assentialing the pottery fragments—a work now being conducted by F W Hodge, sessited by George II Pepper, who spent last summer amid the excavations of the runned pueblo. There will be oergedal interest in interpreting the de-

signs which appear on many of the objects Especially promising are three bowls with the macaw, the goldfine and the paw of a bear, with a pendant feather attached by a string Another bowl bears the figure of a dancer

When the entire collection is prepared when the entire consection is prepared for exhibition in relation to the surround-ings of this present age, we shall find much which will appeal to all of us in the time-worn remains of New Granads as Coroworn remains of New Granada as Coro-nado was wont to call this first of the Sevan Gatles They of Chola lived in cham-bered and terraced dwellings four and five stories high, strongly built of stone and adobe, the original apartment houses of this country, the prototypes of those structures which we latter-day Americans inhabit. The Cholans brought no bound-less wealth to the concursor, and set in inhabit The Cibolans brought no bound-less wealth to the conqueror, and yet in what a mighty city of riches and power have the bones of those who dwelt in that mysterious realm of old come to rest!

Water Tanks of Concrete Staves

Water Tamins of Concrete Staves
THE accompanying illustrations show
The construction of concrete stave
tants developed at Maria, Texas These
tants are used widely on the ranches of
that vicinity Until a little more than
three years ago the concrete stave was not
connducted adaptable to the comstruction
of large starage tanks, some of the leading

considered Ringhadow to the contesting of large storage lanks, some of the leading side builders having the 16 out theroughly also builders having the 16 out theroughly. The drawning shows the details by means of which the concertos stave has been made a practicable device in this connection. The floor is other-creased with expansion loints, which are partly filled with tar or asphalik. It will be seen that the staves for the tank walls are of five patterns—linely and short top claves, long and short bottom stewars, and the full or regular between 18 things proper combination of the contesting the start of the contesting the con

Jar containing cremated human remains covered with a broken howl

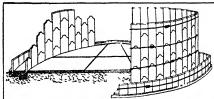

around the outer base of the tank and the steel hoops with expansion joints provide the finishing touch

The Current Supplement

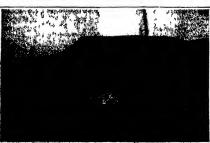

T is fully recognised that the molecule plays a dominating part in every branch of physics chemistry and many other departments of secure. In a paper on Molecular Orientations in Physics and Crystallography

A small tank of concrete staves

The details of construction of the Texas concrete stave tank

Making Old Iron Bridges Stronger

Making Old Iron Bridges Stronger

A bingenous method of strengthening old cast iron
A bindges has been devised by a British major the
county surveyor of shropshire. The fundamental idea
is to encase the original arch ribs in ferro-concrete, thus
making good defecter resulting from cracks and general
deterioration and rendering the studenters capable of
somplying with moder in traffic require in airs.
The first bridge treated in this manner was a cast iron
structure built sity years good you home. Tellored rise
returned to the structure of the control of the cast iron
structure of the years of the structure of the control
defended on the man read between Shreesbury and Luddow, had
long been unift for heavy traffic and in the course of a
careful examination made last year it was found that two
of the cast iron ribs had developed cracks of serious of the cast iron ribs had developed cracks of scrious character at the haunches. On the recommendation of character at the haunches On the recommendation of the major, the county authorities decided that the two defective ribs should be enemed in ferro-concrete, and the work was successfully carried out on the Mouchel Henneluque system No disturbance of the road surface or handraling was involved, the forro-concrete work being executed from platforms suppended below the two outer cast iron ribs. The appearance of the listorie structure has undergone no appreciable change, and bridge is bridge a now very much stronger than at the time of its

The county surveyor has arranged to strengthen

in a smiler manner a second cast iron bridge, built by Telford exactly a hundred years ago on the main road between Shrewsbury and Wenlock

British Steam-Power Economies

FOUR HUNDRED experts have been appointed by the coal controller of Great Britain to consult with and advise steam power users how to eliminate waste As the result of an inquiry by the Coal Control Technical Department it is clear that tremendous wastage of coal is going on which could be prevented it will however, take several years to recover the whole of this loss, even if a supreme effort is made by all the industrial firms, as it was impossible to install more efficient plant while the war was on Another cause of wastage of coal is the employment of unskilled stokers, and, unfortunately, th are today perhaps more men of this description than at any other time, as so many skilled stokers have joined the

There are 45,000 users of steam plant in Great Britain Up to the present reports on 364 firms have been carefully scrutinised, and it is estimated that a saving of approximately 106,000 tons will result This saving can be effected without any serious alteration to plant in the following directions

1 Obtaining greater efficiency in the com-

1 Obtaming greater efficiency in the combustion of fuel 2 Educating of stokers 3 Utilizing the heat in the gases to better advantage 4 Using orthurst steam for heating feed water 5 Adjusting engines more efficiently to use the steam generated 5 Using the but water from the condenser of the control of the

Wartime Agriculture in Great Britain

The Administrative Machinery and the Means Adopted to Secure Land for Tilling

By Major H. Bannerman-Phillips

Title question of the lost simply of the United Ling don in view of the posed with 5 of war with a nation possessing great naval recours a had of course been consistered before the war and the divisibility of national grunness discusse 1 but in thing was done about the lift r and no measures were taken in practime to incourage, agreeditur. If was realized that supplies it must am wheat from abroard would have to be de-"HE question of the f to I supply of the United King must and when from abroad would have to be de-pended on for a very large proportion of the food of the people and though the average margin of reserves within the country was only sufficient for from air wicks to three months consumption there was justified could leave in the ability of the Navy to protect the sea-bone traffice of the British impire. But when Turkey entered the war and Russian wheat could no longer b reckoned on when harvests all over the world gave a reduced yield when tonnage was increasingly required for other things besides food when the submarine menace became serious it was realised by the Govern ment that the supply of meat and wheat from neutral countries would have to be more and more supplemented by home grown supplies

Putting the Farmer on a Firmer Footing

The poor harvest of 1916, with the low condition to which stocks of cercals had fallen made it evident that the problem of the feed supply of the United Kingdom would become acut in 1917 Other factors also seriously would become acute in 1917 Other factors also seriously affected the situation in 1915, partly in response to direct appeal, there had been an increase of 430,000 acres in the area of wheat and 280,000 acres in oats, acros in the area of wheat and 280,000 acres in oats, though this was to a large extent offset by a decrease of 350,000 acres in barley and 75 000 acres in other cereal crops, there had also been a slight increase in the area of potatoes. In 1916, on the other hand the area of wheat had fallen back by about 280,000 acres, while the yield of the crop had been considerably below the average, and, owing to the increasing shortage of labor, the out look for 1917 was serious. It was estimated at the close of 1916 that the area sown with winter wheat was 15 per cent less than in the preceding year. Further the potato crop for 1916 had proved to be one of the worst postato crop for 1916 had proved to be one of the worst on record, and the shortage; in the very important article of food was already making itself felt. The Cabinet, therefore, decided immediately that vigorous action must be taken to secur, if possible, an increased area under creads and potatoes in 1917, and to provide for a program in 1918 which would under the nation to a greater degree self-supporting in respect of cread food-stuffs, of which normally 60 per cent is imported in dealing with the situation, the first essential vas

to strengthen and confirm the confidence of the farmer.

The experience of the agricultural depression in the eighties and minetics, which had led to the heavy decline. eighties and mindits, which had led to the heavy decline in the tillage area, inside farmors heatsto to undertake the breaking up of land. There was on the one hand the growing startity of labor and the rise in costs of production, and on the other hand there was the natural production, and on the other hand there was the natural fear that sooner or later cereal prices might come tumbling It was therefore necessary, if a considerable tillage area was to be secured in 1917 and in the subsequent years, to give the farmers artificial security With this object in view the Cabinet, in December, 1916 decided that prices for wheat, cats and potatoes in 1917 should be guaranteed to the farmer, the same guarantees applying to all parts of the United Kingdom. This program was subsequently more fully developed in the Corn Production Bill with a view to laying down a policy which would make the country more secure, not only in 1918, but in the succeeding years. As in the case of munitions, so in the case of food it was felt necessary to ensure against the risks of a prolonged war. This act, by securing to the farmer minimum prices for wheat and oats for a period of five years, by providing a minimum wage for the agricultural laborer, and by securing powers of entry upon land and requirement of better cultivaere this was found to be desirable in the national interest, laid the foundations of the new policy and

The Machinery of Agricultural Expa

The principles of this policy having been announced, the Board of Agriculture for England and Wales, the Board of Agriculture for Scotland and the Irah Depart-ment of Agriculture and Technical Instruction set to ment of Agriculture and retended instruction set work to reorganise and extend the machinery for assisting farmers in the task of carrying out the program of moreased tillage. It was necessary to develop both local and central machinary, but with the extended program it became more important than over to provide for

it beame more important than ever to provide for greater decentralisation.

Accordingly one of the first steps taken was to set up in every country in Great Britain small War Agricultural Executive Committees of not more than seven members appointed by the War Agricultural Committee of the Country, together with such additional members as the Board of Agriculture might appoint in Ireland the sust-ing statutory Country Council Committees on Agricul-ture were available for the campaign With certain reservations the accuracy of the special more of the Executive, Committees of their preservative more These trusted to the Board of Agriculture was conformed on three Executive. Committees in that reportive areas. These Committees have appointed spread where Committees to deal with e trans branches of their work was he had been dealered to their work was he had been dealered to ecountry, a Datent committee and the act as an advasors body to the Executive Committee and in many countries parant presentatives committee and in many countries parant presentatives in lound with each parath in the country. The Central is lound with each parath in the country. The Central the Committee and the Spread was a special who are exigling members of the Spread was considered and the Committee of the Presented Committees, and who act as inks between the Central Department and the Committee Leach Executive Committees has its own proper staff. between the Central Department and the Committee Local Executive Committee has its own proper staff and in many counties considerable assessment has been their officers at the disposal of the Luceture Committees, while, throughout the country valuable help has also been received from the staff of the Land Valuation Department and the Inland Revenue The County Agrendutural Executive Committees report to the Central Department on the stake and progress of cultivation in their counters and frame estimates as to the possible areas of increased outlivation. They are also charged with the work of preparing estimates of requirements of labor, machinery, fertilizers, seeds etc. and the successful carrying out of the extended program is in great measure. due to the voluntary and hearty cooperation given by members of these committees

members of these commuttees. Alone to increase the At the same time steps were timent to order to deal with the new situation. The President of the Board of Agreeduate for England and Wales appointed an Advisory Commuttee on Food Production and a spicial Bood Production Department wars established in fauntry, 1917, in Scotland and also in It land special Advancy Commutes to the Central Department serve appointed

Getting the Land

The first problem was to form an estimate as to the additional area which could be brought under tillage in the spring of 1917. A rapid survey was made in February and March for this purpose and on the basic of the reports rendered it was estimated that in England and Wales an additional area of 300 000 acres, and Scotland of 50,000 acres, might be secured. Under the Defence of the Realm Regulations the Boards of Agriculture for England and Wales and for Scotland had be given powers to enforce cultivation where they con-sidered that the land was not being properly tilled, and these powers, with certain exceptions, have been delegated to the County Agricultural Executive Com-mittees Acting under these orders, the Committees mittees acting under loces orders, the Committees can serve notice on occupiers r quirng them to cultivate their land in such a manner as the Committees think necessary or, where no improvement takes place as a result of warning, the Committee may take possession of the whole or a part of the farm and either cultivate it or let it to new tenants.

of the whole or a part of the farm and enner cutavase or let it to new tenants.

The Committees report their proceedings each week to the Department, and the pleture they give of the agricultural conditions of their countes shows that large parts of trust England had such into a vertical slough of despond. Case after ones was reported of considerable areas of land which, having at one turn produced good areas of land which, having at one turn produced good careas of land which, having as the port, allowed to bocome derelied or fared in the pure sport, allowed to bocome derelied or fared in the pure sport, allowed to bocome derelied or fared in the pure sport, allowed to bocome derelied or fared in the pure sport, allowed to bocome derelied or fared in the production of the land for their Prisilipood, and for whom there is no excuse on the ground of lack of the necessary capital in other cases, however, farmers had been allowed to obtain possession of far more land than they were able to cultivate adequately with the capital at their disposal, and in some parts of the country there are large areas when formerly supported a considerable population, where the houses and buildings had been allowed to fall

into ruin and the land had been used merely se an-tensive sheep or eattle ranges. Wherever pessible such places are being dealt with by the Onsaltieses, but smarp of them will require new buildings and other works on a scale impractable during the way.

scale impracticable during the war.
All powers recident in the Commisses have been exoroused, but in the main the increase in tilhage in England
and Wales and in Scotland has been obtained by voluntary appeal to farmers. In the case of the 1918 program,
however, which provides for an increase in the arable
area over 1916 of 2,700,000 acres in England and Wales and 350,000 acres in Scotland the Boards of Agriculture have allocated a quote of this amount to each County Agricultural Executive Committee, which is empowered to serve notices upon farmers in its area calling upon to provide a certain amount of additional til them to provine a see what amount of countries unage The Committees have been engaged in carrying out a detailed survey, in order to apportion their quota among different farms, to eshedule grass land which might with advantage be plowed up, to secure as in-creased area of coracia, roots and potators on the satisfing arable land, and to ascertain any land which is not oring cultivated by the present occupiers.

In Ireland a different procedure was adopted.

In Ireland a different procedure was adopted. The Department of Agriculture and Technose Instruction, by an Order in Council of January, 1917, required all agricultural, holders of over 10 acres to increase their arable area in 1917 by 10 per cent, except where a arable area in 1917 by 10 per cent, except where to arable area on any farm already amounted to 80 per cent of the total area suitable for arable cultivation with the second of the second of the second of the total centre of the second of the second of the the 1916 area, with a further five per cent increase in the second for the house of the second of the the second for the house of the second of the the second for the house of the second for the second the case of farms having 200 acres or more of arable land.

New Agriculture on Old Lands

Stops were also taken to survey areas of land where production could be improved by dramage. In almost every county there are thousands of acres which might be used for agricultural production if properly drained,

sery youn'y insize are incusated at some what magnets be used for agreembart, production if properly drained, be used for agreembart, production if properly drained, unspected and sported on, and several schemes have been upon the operation when would secure an immediate improvement in the land for tilinge purposes. In Scotland also a nurvey was made of deer forests with a view to restocking tracts of land with sheep.

A great live-took industry has been built up on the wonderful permanent grass lands of England, but the wonderful permanent of the comproving may be the usual method of plowing up the land has already secreeding, and and the properly the lands are sufficiently and the second of the possible to use the arready secreeding and for raining hay A method with this object has been devised by an England farmer and tried by him with second on a small scale during the past year It was described in the Scustivity datasets for June 29th II the plan is subjected on a large scale that year, as is now toest revised by an Joigan tarmer and tred by him with control of the Secondary flow past year. It was clearly deal to the could control of the Secondary flow past year, and the plan is adopted on a large scale that year, as is now proposed, it will mean more grann this year, more best next vinter, and more outs, wheat, hay, and grasing in 1919. If the new method is as successful over a large acreasy as it has provide to be an the experimental stags arrange as it has provide to be an the experimental stags arrange as it has provide to be an the experimental stags arrange as it has provide to the control of the stage of the control of the contr

Old Names for a New Navy

The Beroic Associations That Attach to the Names of the Famous Fighters of the Past

SCRETARY DANISLS has issued no order so sempletely popular as his reling that our five now hattle-crimers shall be designated the "Constitution," "Constitution," "Beautops," "Lastington, as the second of the constitution of Ranger "The Chief of the Navy Department has brought back to our first fighting into traditions as second as they are old of the control of th of one's country from therdeck of a "Constitution' or a "Nasgara," is to see yet keener dage to the characterstic American fighting qualities. "A Broken Idol"

To the Editor of the Scientific AMERICAN

I have just read and reread your editorial in the issue of November 28d under the above title trying hard to get at the root of what you mean There is no single get at the root of what you man. There is no single statement in what you say that I would oppose but there are underlying implications that will be used to thwart the great cause of the League of Nations whether you intended it or not

No man can be a good citizen of the world who does not thrill with pride for his own country But no man is an intelligent patriot no matter how great the sacrifico does not work for the establishment of an international system of justice that will be less haphasard than the sevolent anarchy (from our standpoint and that of our

sessives anarony (rom our sanopoint said rate our Allies), that has been proven so insufficient.

The oreston of the League of Nations is the supr me task of our generation. We can not styre in advance all the great problems of the future but the organization of the machinery of international control is our sacred duty, the neglect of which would make us slackers to

posterity

The time is ripe, and every publication, scientific and
otherwise, should rejoice to use its space to arouse men
to this great mural and spiritual mobilisation. L O McArsa

The Oil-Cooled Keresene Engine

To the Editor of the Scientific America. I consider rates the highest to express my appreciation of peur article on "Gil-cold Kenesson Engine," that appeared in the Nevember 10th Scientific America. Your exhiberitainty statement of the facts in this case in the mean visionment of applied that I have read for

quite a time. Incidentally may I add that for several years past I have been giving quite a bit of time to the study of such a development and including no small amount of simple physical experiments. Might mention that in this same assue of the SCIENTIFIC AMERICAN I was favored with a brief mention of a patent on temperature control means

control means As unnatural as it may sound to you it has been my experience to learn that even many swell known automotive engineers although devoting valuable talent to the perfection of the industry are apparently uninformed or not open to conviction as to the undeniable possibility of the great increase in fuel efficiency that is inevitable with the adoption of internal combustion engines deagnod to operate at higher temperatures. In fact statements that I have received in reply to my inquiry as to their attude along this line are so elementary and unappreciative as to become absolutely disgusting. It is my fervent prayer that more engineers of your kind shall eventually see fit to impress this fact upon the minds the state of of the masters of the engine world. I am sure that the result would be that the near future will see an evolution that will surpass any of the truly marvelous innovations that have done so much in the past

trust that this simple note of appreciation will at least tend to soothe any effect of averse criticism that your article may have brought upon your head

Anderson, Ind HARRIE & COV

The Electron Formula

To the Editor of the SCIENTIFIC AMERICAN

With reference to the electron theory of the physical and mechanical universe I would like to recall to e SCIENTIFIC AMERICAN the fact that the Alfred Nobel \$40 000 physics prize awaits the discoverer

of the electron formul

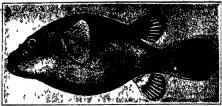

In 1906 Sir 1 1 I homson of Cambridge University In 1998 Str 1 1 Homson of Cambridge University hagland was awarded the Alfred Nobel \$40.00 physics prise for advancing the electron theory and it has been suggested that a securitie society be organised to devote its entire time researching for the electron formula. The writer would be pleased to hear from those who

believe in the electron theory when we may eventually reveal the great law of the universe through the columns of the Scientific American

Weeding Out the Poisonous Fishes

How Scientists Are Tying a Figurative Bell on the Dangerous Denizens of the Deep

MR L W CUDGER Pricesor of Biology of the North Carolina state Normal School in behalf of the Carolina bestitution Washington has been engaged at the American Museum of Natural History. New York studying poisonous fishes. In Washington a section of the Bureau of Isideries under Dr. Hugh M. Smith Director is husy on similar lines In California, Dr. David Starr Joidan President of Stanford Uni versity is strenuously at work testing all kinds of fishes available. There is a universal and feverish effort going on in different institutions to test up all products of the salt and fresh waters of the world to get at of the said and from waters of the world to get at everything edible and throw into the distant everything unfit for human food. As to the latter every effort is being made to find some kind of utility for discarded species either for leather fertilizer commercial or dicinal oils etc

Possoneus fishes for convenience may be divided into those forms which are unsafe to est and the types which by their bitts are destructive to edible or useful which by their litte are destructive to orbible or useful fables and danagerous to man. There are also said little of conditions which are unastic four instance this bluefish the most popular manue food in summer will it it happens to feed upon decayed mosebunker used as chain by commercial fisherima or anglers not only make ill those who rest it but cause the face and other parts of the bunna body to brack some interest or the competitions. rash The carmivorous bluefish in the ocean which feeds ravenously on schools of mossbunkers which it follows is perfectly edible when taken by net fishermen When however the mossbunkers enter the bays to breed they stick to shallow water where they are safe from pursuit It is then that the bast beats offer seed messbunkers (or menhaden or oilfish as they are called) for the use of commercial ishermen and thousands of pleasure anglers. The need mossbunker soon decays in the heat and the bluefish that fill up with him become permeated with alkaloids which they convey to the stomachs of human. It depends upon the human stomach involved whether there is immunity or not from hah alkaloids and ptomaines

Still another source of danger to humans is the fish that have died which are sold in the markets or caught In Furope net fishermen or anglers who with a hook. In I urope not inhermon or angiers who allow fish to die in the air are prosecuted and punished to the extreme limit. All fish caught in Luropean waters must be butchered alive. Even the hook angler

catching fish for his own home consump tion, must kill each fish with a knife im mediately upon taking it from the water Government inspectors to out with fishing fleets. They require that fish must be butchered alive the same as steers and the carcasses thrown into iced holds. Only lead or frozen fish can be sold in the markets or peddled in America few such precautions are taken and hence the vast amounts of decayed and unfit fish consumed, bearing toxic alkaloids to the human stomach Hence also the vast amounts of fish rondemned by boards of health as unfit for consumption of health as unit for consumption. When an angler, for instance, kills has fish with a knife as fast as caught he can put them in has bag or box with p rirect safety. A butchered fish, if loft in air or sin will be protected for hours by its own skin and be perfectly safe eating for some time

The other form, the fish that exude

posson or posionous bacteria fatal or detrimental to humans and edible fish,

also most deeply concern the laboratories. It seems with that all such forms should be tagged and placed most all the seems of the seem sonous to humans Strange as it may seem, the poisonous to humans Strange as it may seem, the blowfish which was formerly regaided as a pest by anglors has for several years become popular for the frying pan Upon its back are two strips of 'tender-

Picroise volitans, a large and much feared stinging

loin." Not only have anglers of late been greedly stripping these off, but the numerous fishermen a small hotels along the coasts have been serving the tenderloins as a deliracy. Yes this fish is poisonous and should not be eaten except by people whose atomachs are as immune as a goat a or ostroin s. Dr. tudger also warms against eating the berrauda as a fish causing promaines in humans from toole basteria. Some of the most poisonous fish of the world are found in the waters of Samos, Hawaii and the Last Indies generally although for that matter, equatorial waters everywhere have their peoular forms. Of these the

family Tetraodon tidae is most conspicuous. It is difficult to understand why these fellows, heavily armored as they are with stout spines, stout laws and teeth, should also need to crude posins for their protection from enomies. Jordan and Searle describe the several species. The group are more shundant in the East Indies than the South Seas. Phey are regarded as poisonous, although none of the species has the bad poisonous, authorign none of the species has the had repute possessed at Hawaii by Tetradoch hispatius. The natives call them sus, meaning puffers, or blowfish Hispatius is very abundant in the lagoons and mullet points. It is regarded as enceasively pointonus, mustimuts or deadly death, being its local name. Nigrepunctatus is very common about Apla and Pago Pago, and is likewise regarded as poseonous. In some instances the body is covered with bristles so long as to give stances the body is covered with brasiles so long as to give the appearance of cearse four The highly colored family Lutionus mostly with red shades, has possoones species of which monestigms as a conspicuous example. It is common at Apia with a coppery red coloration, and has no text ho not its lugue or Another large, brack-red species of the family, boths: with large canine texth, is possonous it ranges widely in the Esse Indice.

'Pterous volitans is a large stinging fish of Samos, Tahiti New Guinea, New Britain and the East Indies It is blackish red in color The natives call it Sausaules, because of its fluttering butterfly flight in water' It will be noted that this fish somewhat resembles the Atlantic sea robin in appearance There are however, tentacles on the had and it is armed with kind-like sprines and is anjable of stanging in all directions whatever it comes in contact with The sings of some fish are as deadly as their bites This fish also has bands of minute teeth to string with

are as deadly as their butes. This fish sho has bands of minute teeth to sting with.

Of the deadly sting rays of the Eastern Indian waters, Jordan and Seale name a new one, Rusantive Jos. The Tabitine call it Jos, the New Zelanders who and the pignas cos. Bung rays are severywhere deadly, on our begans of the Russian state of the Sealer water. Many prominent fishermen have been killed by their stings. They are difficult for layment of detanguah from ordinary skates, which fact should make all persons cautious in handling these triangular fishing. The rays have long whip-lash tails. In the sting ray, there are on the tail below the body, two portunding spines, or stingers, which the animal is vary deft in thrusting into his animycers by squarms, whether in water, in beat inch as animal superior of the sting still the would not the condition of health of the victim. The sting fluid, or fast sificate invested with tone besterns, quickly circuisties with the blood, permeating the whole system. Many people have been killed by the sting, and the life of Capt. John Runt is a slegged to have been saved following a threat only after eight another of careful trees only after eight promise.

by it mosts of careful treatment and number of careful treatment and number following a threat by a sting ray

Changes in Iron After Repeated Heating

Changes in Iron After Reposted Heating
AT a recent discussion before a large British technical
Associaty of certain changes in cast iron after reposted
to the control of t actual volume, but only a change in the position of the steel Incidentally it might be remarked that the result obthe third suggested the somewhat startling hypothesis that if an oblong bar of soft steel were to be heated and cooled a sufficient number of times under proper

conditions it would eventually assume a globular shape conditions it would eventually assume a globular shape An almost perfect instance of the effect here so well predicted was cated by another metallurgair at the same meeting. In order to warm a small tain of water used for molding purposes at the workshop of Robert Rogers & Co., Stocktos, England, a piece of tron, weighing several pounds is facted over a color branning-five of blood-red fact, them questioned until it as nearly cold.

nt centode (2) the deadly pigs or 1 lie centode below the head at r s the centode enlarged from a d a neter of 9 millimeter (4) larval centode proboscie of the centode enlarged (5) three enlarged views of the cer Poisonous parasite (enlarged) which the sting ray injects into the wounds it creates

Some years ago a cylindrical pit c of soft steel similar in shape to that shown in the illustration was cut from a rigid har of about 3 8 inches daimstr. and used soled for this purpose. The analysis of the steel was a follows Carbon, 00 5 per chri silicon 00 10 per cent phosphorus, 008 per cent suipplier 005 per cent managance 0 45 per cent

About 200 heatings and querchings were given in a

After 800 heatings and quenchings, the block of steel shown at the left had developed the shape at the right, passing through the central stage

your and in the course of four years of this treatment the orlandrical piece had gradually become nearly sphoreal in shape, as shown 'n intermediate stage in the transformation is seen in the center figure of the illustration, which is a photograj in of a smiller piece after it has been subjected to about 200 quenchings. The remarks quoted above are clearly illustrated by these examples, the pressure on the botter internal

metal due to the more rapid contraction of the chilled outer layers having ulti mately caused the piece to assum the globular aspect shown in the third or second figure of this illustration. Meas urements taken indicate I that after 800 quenchings the cylu for had contracted in length about 0 5 in 1 s and hal also increased it width by a corresponding amount. Fach quenching it ust therefore have caused a maximum displacement of material in a lateral direction of about 1/1000 of an inch

Pressure Marks on Photo Plates By M Luckiesh

SEVI RAL years up while scrutimizing D some photespi tragraphs for fine detail certain irregular markings were found which excited a suspicion that they might be made by ions present in the ai owing to the particular conditions sur rounding the work I urthermore owing to the fact that these tracks were found only on one type of panchiomatic plates and not on any of a number f other types of plates while were used it appeared that they were peculiar to thus particular plate for some reason \ arious experiments were conducted to ascer tain the origin of the tracks including the development of several dozen new plates which were unpacked in the dark room and immediately developed without being subjected to any possil influence in the laboratory The tracks were in the laboratory I he tracks were found on all these new plates of this type

which were obtained several years after those on which the tracks were first noticed and further investigation did not reveal any on other types of new plates

It is a fact of photography that a latent image can be

It is a fact of photography that a latent image can be impressed on a photography platt by minute abrasions of the emulsion surface. These are known as pressure tracks. The particular typs of platt under considera tion appeared to be packed as well as others in the gright of the packed as well as others in the packed as the packed as well as others in the packed as the packed as well as others in the packed as the packed as well as others in the packed as well as others in the packed as the packed as

of gritty substance being rubbed against the caulsion because similar tracks were reproduced in this manner by using fine particles of sand. The individual mark particles of sand the individual mark ings or pressure marks are too small to be troubles me in ordinars photography but are visible under careful observation to They can be very anthe maked eye They can noying in photo microscopy

noying in photo meroscopy

The illustrations are high inagituteations of the original tracks and are of some interest not only photographically but from the standpoint of the auties of a small particle rubbed between flat surfaces. Fig 1 is the result of magnifying age a nest of tracks about fifty times. The long trail appears to have been made by a single particle. This portion is seen at a higher magnification (about 126 times) in Fig 2 although in cidentially this photograph is aversed as if Tie 1 a were contact that the property of the property of

Mechanical Equipment of the Farm

Latest developments in agricultural machinery and practical suggestions for the farmer

Constacted by HARRY C RAMSOWER Preference of Agrecultural Engineering Other State University

Dredging the outlet of an open ditch drain

Machine for gathering own and binding it into bundles

Cleaning and Deepening the Open Ditch

ONF of the phases of farm dramage which is too often neglected is the open ditch i or land dramage we rely upon underdrams almost exclusively but all tile rely upon underdraus almost exclusively but all substances or many into the spen dato. The wital importance of this ditch comes from the fact that no under dram can be better than its outlet permits it to be More often that not this outlet ditch is filled with grass weeds and trash to such har state that the tile emptying into it are completely elogged at the outlet and are thus largely uncless.

In large ditches serving as the outlet for a considerable area of underdrained land the dredge is used to good advantage. If a large volume of water is present a floating dredge is perhaps most convenient. In the greater number f cases however large ditches are needed—too large to be cleaned and deepened by the use of horse drawn scrapers yet not large enough to take a floating dredge

noating trenge
The dredge shown on this page might be called a dry
land dredge. It is supported by heavy timbers on the
banks of the ditch. A convenient frack is laid over
which it may be propelled. Its powerful host enables
it to cut through trash roots etc with comparative case.
Where the extent of the work justifies it will always pay. to use a machine of this kind rather than to rely on ordinary scrapers drawn by horses

The One-Horse Gasoline Horse

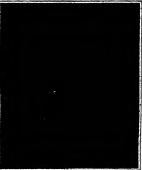

THE title may sound rather odd yet no other term seems to convey the right meaning. The larger sized tractors are intended to do the work of two four six eight or more horses and many times they are thought of in terms of the number of horses whose power they of in terms of the number of horses whose power they could But the one-horse tool as a necessity on most farms while in many instances as on small farm of the more than any other tool. It remained therefore for someone to design a machine that would find favor where the one horse poly was the chief saus or where a consider able amount of hand labor might better be done in some ore rapid and more profits able way.

The garden tractor shown on this page is the result of effort along this line. As the machine stands it is 72 inches long 17 inches wide and 36 inches high. It is equipped with a single-cylinder motor 31,2 x 41/2 bore and stroke with a belt speed varying from 300 to 2 200. The total weight of the machine is 550 pounds

It can readily be seen that this tractor is capable of doing only very light work The plaw which it is intended to pull uts a 7 inch furrow and the various tillage at-tachments are of correspond tachments are of corresponding size. It is easily handled in garden work. There is, nulley attach in garden work. There in addition a pulley atte ment which can be used for light belt work. The diam-eter of the pulley is 43% inches and it runs at 800 revolutions per minute at

normal engine speed
A machine of this kind. onestly built should fill a eal place in our immense ruck gardening business

The individual who washes a garden of something larger than average size can use it to good advantage. If might also be used to faye a large lawn mover where a considerable area must be out regularly but where the sus would not justify a power mover. The hole difficulty which users of its type of machine will encounter a this—they will expect too much of it. Its limitations must be recognized. It really does not possess the power

Plowing with a ens-horse gasoline horse

While it is true that a horse at steady work of one horse. While it is true that a horse at steady work cannot develop more than \$\frac{1}{2}\$ flores-power, yet in an emergency and for a short time he can multiply this effort many time. It is first this reason that those who have been accustomed to using horses are frequently daspointed when they indertake the use of motor power. This is not a cititetism of motor power that statement is made to federated possible disappointeems.

The gaseline heree as a stationary engine

A Loading Attachment for a Cornbinder

I T has long been recognised by practical farmers that the handling of the corn crop is one of the hardest take of the entity year and one phase of farm work which, in spite of numerous labor saving meahines, still calls for a large amount of hand labor. The various types of so-called aled cutters work very satisfactorily if the corn stands un well but now from the composition of the corn stands un well but now from the corners to lead and stands up well but oom frequently becomes lodged and twisted so that these simple machines cannot be used at

all The corn binder will gather and bind into bundles, even badly lodged corn, but it is not an easy task by say means to pick up and set the bundles is aboults. A number of attempts have been made to devise shocking arrangaments for different forms of corn bavvesters, but none of them have nest with much success. It has always been found next to unpossible to make a shock that would stand erect for any langth of time. In the hands of a skulful operator fault good work can be done, but, in the main aboutlers have never become widely used

The attachment shown on this page has already be nto suscentinent known on this page has arrively been to wide practical use and with conniderable satisfac-tion from the mechanical point of view That it is a remarkable labor saver there can be so doubt. It san be used, of course only when the corn is put into a silo, but this means no small amount of hard work and hand labor saved annually, when the country as a whole is

considered
The photograph at the head of this column shows
the machine in service, being hauled by a tractor
drawing the core to the control of the control of the control
drawing the core bunder. This tool is a lower dust
machine—more than a load for two horses, and it seems
to be rather awkward and inconvenient to use more than
two Further, the machine works much better if drawn
at a steady rate.

Coment Drain Tile

THE question as to the merits of sement drain tile, especially their desirability as compared to day tile continually being resised in the missed of farmers. This is a proper question and deserves consideration in the first place let it be said that there is no reasons why first class drain the should not be made from estimated and good, deen send or fine growed. The makerials should be missed in a proportion and lesses that it, we need to consist to these said of the day of the said of the sa

The Continuous Nitration of Hydrocuris

The Openinsone Nibration of Hydrocarbides of Paris mirration of hydrocarbides, or griserine and of a solitions, which is the previousnary steps in the manifestits of providers and other explosives, was nearly askeys a discontinuous openation before the war. This discontinuously was practiced in order to avoid the danger string from the high temperature discontinuously on compactavely small quantities cooling in facilitated and charger in the sace of explosion is insisted. But the sace of explosion is insisted. But the sace of explosion is insisted of the present war and the searcity of man power have caused in receives to such processes permitting restriction, at its seat in the case of insistence produced in the present war and is the case of the produced produced in the case of the produced presents of the search of the present of the principle of the well known absorption columns and gas weathers. The meaner in which it opens the has been recently described by A. Siethscher in Technical and for the present of the present o

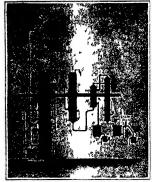

As shown in the accompanying diagram the apparatus consists essentially of three colonins. A, in which the situation of the bennine is effected. B, which is a waher in which the nitrobeanies formed in the column A is freed from the soids which it has carried down with it,

siteration of the hemita is effected. B, which is a washer in which the airtobeanise formed in the column A is freed from the acide which it has carried down with it, and C, in which the airtobeanise is dutilized.

The disseases and the relative position of these three columns have been so arranged that the liquid streeds from the first to the last merely through the state of the reservoir G which contains the suffonition seld muture. Furthermore the cesspe valves also essure regularity of flow throughout the whole apparatus.

The brainest counting from the reservour D, after having passed into the regulators of flow throughout the whole apparatus.

The state of the regulator on (which regulates both the flows and the presence), passed throughout D, after having passed into the regulates from the state of the sta

The general scheme of the apparatus for continuous nitration For the reference letters see the text

The continuous cooling of the liquids in the column of nitration is insured by means of four cold water serpen tines placed in the middle portion of the column. Then flow is regulated automatically by internal thermometer which set in action distribution sluices by means of

The exhausted said collected in I is almost free from

To illustrate his suggested changes in the standard railway tie, a French investigator presents these diagrams, which are explained in the text

nitric acid it is dilute sulfuric acid which may be use again in the manufacture after having been reinforced by the addition of olsum or sulfure anhydride and of fresh nitric acid Finally similar apparatus to that just described makes it possible to transform the mononitrobensine into dinitrobensine and the latter into trintrobensme

Improved Sleepers for Railroads

A FRENCH railroad engineer M A Auric has come to the conclusion that the priest method of constructing roadbeds is faulty in principle and is largely responsible for the wear and tast to which they are sub-

His criticisms cover three main points the rigidity of the cross tie or sleeper in the longitudinal dir tion the manner in which the rail is fast incl to the sleeper and the insufficiency of support at the junction of the

and the matflixency of support at the junction of the rails. In a recent article in J. Germs Crist has apported his argument by the use of the accompanying diagrams. Or and D. According to M. Aurie it has been provine by experiment that the loads and the shocks which are transmitted simultaneously to the ties at C and D are never equal or even approximately equal on the con-trary almost the total amount of the load is transmitted. trary almost the total amount of the load is transmitted integrally first at one point and then at the other because of the unavoidable signagging pitching rolling ste in the motion of engines and ears. Because of the rigidity of the ite in the longitudinal direction these and uneven loads cause it to rise (and fall) now on one side and now on the other and the incessant vibration thus occasioned tends to disturt the ballast of the road bed and causes the fastenings of the rails to become

This disadvantage can be remedied M Auric believes, by the simple method of making the tie thinner in the middle as indicated by the dotted line E F G thus preventing the two ends of the tie from having too closely conjoined an action and allowing them to act inde-pendently of each other under the strains and streams imparted by the load

Figure 2 represents the present method of fastening Figure 2 represents the present method of Isstening the rail to the tie in the transverse direction by means of cramp-irons etc, fixed upon the upper surface C D of the tie this upper surface having a width of 0.15 meters to 0.20 meters (5.8 junches to 7.8 inches)

meters to 0.20 meters (0.8 mones to 7.8 menes)
Obviously when the rolling load at M to the left of
C the tue will have a tendency to ank at A and to rue
at B when the load is at N to the right of D this action
will be reversed the effect of the constant oscillation is while the same as in the preceding case the loosening of the fastenings and damage of the ballast. The remedy proposed and illustrated in Fig. 3 is equally simple, proposed and illustrated in Fig 3 is equally simple, and consists merely in reducing the supporting surface C D to the minimum consistent with safety when suitably CD to the minimum consistent with salety when suitably reinforced. The weight of the load will thus be trans-mitted as nearly as may be to the center of the base of support A B which will have the effect of checking the vibration

As regards his third criticism the insufficient support of the rails at the point where they are joined M. Auric proposes that cross-ties should be done away with en tirely at such points and replaced by girders as shown in Fig 4 At present the practice is to place the ties closer Fig together at the joints than elsewhere giving the rails wide bases of support The longitudinal rigidity is thus increased with a corresponding increase of vibration.

As a consequence it is precisely at these points that the roadbod is most subject to damage.

Building a Bridge by Halves

HOW can a bridge be opened to traffic before it is completed? The answer is simple and obvious Build half of it at a tune so that traffic can use the completed portion while the other hall is finished in due

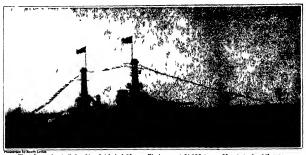

A typical case of bridge-building by halves is that of the attractive concrete structure recently completed across Lake Quinsigamond at the eastern edge of cuty of Worcester Mass

As will be noted in the accompanying illustrations this bridge was so much in demand for traffic crossing the lake that half of it was completed or from the el aborate arched face to the center line including a single track for the street car line The first half was completed and finished, even to the or-

and the asphalt pavement
With balf the Quinagamond bridge opened to traf
fic the builders turned their attention to the construction of the other half

bank. As real Concrete forms to pisce on the unfortan

Artificial Limbs in Quantity

VITH the greatly : reased demands for artificial limbs brought about by the great war manufa turers of such products have been complied to resort to quantity production methods. As a many of the have matalled automatic shaping latl es of the typesh we

ir the two ac omparying illustrations. As will be noted the operator | la es aroughly at naccof woodin the machine and then turns on the power I he cutting knives are guided over the rough piece of wood through the agency of a cirved rod which rests against a master wooden leg held at the rear Thus the cutters only remove as much wood as the master permits and the result is an exact replica of any kind of limb held at the rear
It will be seen that this

is another application of the

pantograph principle which has been used so much lately—notably in making propellers

The Rotary-Pole Magneto

A LARGE part of invention consists in A mere mechanical improvement a touch here an added detail there to make existing equipment function better

ldom that brand new prin ciple is laid down and applied and this phenomenon is therefore the ore interesting by virtue of its very scarcity We imagine that it must have been in pessimistic brooding over thu fact that the now

famous patentex aminer of the 1830 s who resigned because everything had been invented

P rhaps it will not be going too far to Primaps it will not be going dool as a put in the class of basic inventions the rotary pole magneto developed since 1912 for while this apparatus like older types ignites the cylinder charge by means of an electrical spark it makes in means of an electrical spark just about the production of this spark just about as fundamental a departure from estab-lished procedure as the nature of mag

netism and electricity would permit
The ordinary magneto embodies a horse The ordinary magneto emboures a state with the poles built out in concave pole pieces to provide a seat in concave pole pieces the armature. The in concave pole pieces to provide a seat in which rotates the armature. The magnetic flux that — ws between north and south poles of the magnet passes through the metal of the core in preference to the atmosphere because there it meets to the atmosphere because there it meets less resistance. But as the vore rotates the path through it of the flux must be reversed. While the shaded end E is in contact with the north pole N in the left-hand diagrams the flux enters at

the left-hand diagrams the flux enters at E and flows from I strough the core a moment later E as in contact with the south pole, and the flux must then flow through the core toward E. The electric current induced by the magnetic field in a coil of wire exposed to the action of the magnetism by being wound about the core, has a mannoun intensity when this reversal of flux takes place and the sharper that reversal the

greater the peak of the current. Since it is this peak that produces the spark in a magnet anything that operates to retard the flux reversal makes the currentpeak weaker and the spark less officeent

It the armature magneto there are two influences so working. The iron of the armature shows a tendency to

Rough stock in place ready to be shaped into an artificial leg

maintain its polarity a reluctance to reverse which slows up flux reversal And when the armature is in the third position shown it is neutral the ends are neither north nor south but are in contact with both poles and trying to be both north and south at once Flux

ore The general arrangement is shown in the cut. The rotating shaft runs from in the cut pole to pole across the gap of the magnet, ne longer through that gap between the poles. The pole-pieces are mounted on the shaft and when it rotates they rotate in contact with the poles. In place of the armature we have two field-

pieces partly surrounding the middle of the shaft, just as stationary pole-pieces partly surround the armature To make party surround the armature 10 make and break the magnetic circuit, each pole-piece has a lobe that projects, parallel to the shaft far enough to brush the fieldpieces in rotating These lobes are opposite one another on the shaft just

polarity causing a definite magnetic abort-curouit during the instant of bridg-ing with a seavenging effect that alimi-nates all stray lines of flux, and clears the current intensity is thus obtained which the old-style magneto cannot approa-

This means a better spark, more there ignition, more rapid more complete combust and as a final consequer

ore power. Nor is this all The arm Nor is this all. The arm-sture magneto gives exactly two sparks for each revolu-tion of the armsture shaft-one for each flux reversal. But the tendency in engines is ever toward more cylinders, which means more sparks per revolution of the engine shaft. This demand is met by a gear bet shaft so that the latter turns faster than the for-mer but even with this, we

mer but even weta tank, have by no means dispo of the matter completely Engme apoed are always going up, A while ago a fair average was 1, revolutions per minute Today few gines work at less than 1,400-1, revolutions, the Liberty makes 1,9 while the latest wrinkle of increase power by gearing down from shaft

then mean say-where from 5,000

shaft, and this, is

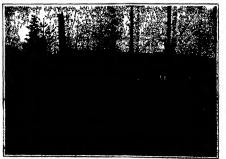

Three stages in the working cycle of the armsture magneto (left) and of the retary-pele type (right); and the general arrangement of the latter (center)

and in both directions through its shank. making for gradual rather than sudden reversal Indeed this is actually the process of gradual vs sudden reversal, so the peak of the current in the coil is

In 1912 the first patent was granted for a magneto with rotary poles and fixed

as are the armature ends in the order type. In operation the rotary pole-piaces retain their polarity without reversals. There is thus less reluctance because less thus less reluctance because less than the control of the property of the over in this neutral position there is precision instead of confusion. The gap is now bridged by a place of constant now bridged by a plece of constant

Making or Marring the Strength of Steel

PIECE of steel is a bundle of very short fibres, more or less hard according to the amount of carbon they contain, more or less strong according to their relation one to another

When a blacksmith heats a bar red hot and forgos it out into horseshoe shape on his anvil, all the fibres of the steel are bent into the horseshoe shape of the finished forging. They remain in proper relation one to another. There is no decrease in their strength

If, however, we were to make a casting of this horseshoe, the fibres would run in various directions, and this would be a source of weakness. The metal would be hard, but brittle

This is why forging is superior to casting where both hardness and tensile strength are needed, and it is why forgings are now, to a very great extent, supplicating castings

Now, even in forging, there is a right and a wrong way of hammering

If the forging is ignorantly or carelessly made by a single great blow of a drop hammer, the outside fibres of the steel are more compressed than those on the inside

If, on the other hand, the forging is made by a series of carefully calculated and nicely adjusted blows (such as only long experience can accomplish), the fibres are more evenly compressed throughout, and a finer grain and greater strength result

By an intensive and exact knowledge of steel and its methods of treatment, by the ideal, best expressed by C E Billings when he said, "into every forging goes our entire reputation", by half a century of steady progress since Civil War days, this company has reached its present position in the estimation of the world

The American Ace airplane ignition

Victor in a thousand battles!

Leader by right of achievement!

Holder of flying records!

Reliance of airmen the world over!

The magneto, recognized by every fighting nation as the incomparable form of ignition, has the Aero Dixic as its supreme representative by virtue of its selection as standard equipment for aircraft engines by the U. S. Government.

A product of American genius, built in an American factory by American workmen, this super-magneto answered war's uncompromising need and will meet every requirement where reliability, efficiency and simplicity are considered more essential than low first cost.

For pessenger cars, motor trucks, tractors, motorcycles, motor boats, stationary engines, Aero Dixie type magnetos make the war-tried ideal ignition system.

Are You Going After Foreign Trade?

If so, are you sure that your inventions and trade-marks actually belong to you in foreign markets?

Unless you avail yourself of the right to acquire foreign patents and trade-mark registrations, you may find that another has preceded you and has actually appropriated your inventions and trade-marks and obtained legal ownership thereof, whereby he can bar your goods from foreign markets Such a proceeding is permissible under the laws of many foreign countries

Many have lost their markets in certain foreign countries by overlooking this fact

Many of our clients are preparing to extend their business by seeking patent and trade-mark protection in foreign countries

We should be glad to have you avail yourself of our services

Reconstruction

A Department Devoted to the Improvement of Old and the Develops

n up cd a new department sumed to a n un cd a new department aumes to assess it the reconstruction of our undea-tries in those unsettled days following the signing of the armistice Many lecture to the Reconstruction Editor or mending the Scientific American for un) rinking this service Manufacturers while have built up organizations for the king new lines of manufacture adapted the machinery with which they are quipped have written the Editor for information regarding promising invasi-tions and for suggestions on new lines of immuniacture. Responding to these ap-peals our readors have offered many interesting ideas covering a very wide range of subjects

Manufacturers are urged to tall the Reconstruction Editor their needs He Reconstruction Editor their needs He will be glad to help them with their problems and if they so deare, will withhold their names from publicity so that they may not be deluged with a flood of correspondence from unreacted invested and their constructions. ondence from unpractical inventors By stating in detail just what th iems are what is their equipment for new work and the character of the work they would like to take up they will facilitate the task of the Editor and eliminate much

Inventors are urged to exercise judgment in presenting their wares A well developed invention that can be demonstrated with a model is far more likely to receive con sideration than one which merely exists on paper A photograph and blue prints of working drawings are far more con-vincing to the average manufacturer than vincing to the average manufacturer than a patent drawing One correspondent submits his patent claims without any accompanying illustration Some of our correspondents have offered good suggestions which they confeas are not protected by patents Some have trad to sell mere ideas not embodied in any concrete form—ideas so vague that, if would require the exercise of inventive faculties to develop them sufficiently to be patentable Obviously such suggestions

are practically worthless The average manufacturer is not an nventor. He does not care for abstract ideas Inventions must be presented to the patents that cover the nventional because a patent is evidence of novelty and a guarantee of protection from com-petition But in order to gain an adequate conception of the invention he must have it well pictured and preferably embodies in a working model

Those who are prepared to submit a working model should so state in their letters Do not send models to the Re-construction F ditor He cannot handle them Instead send him photographs of models

are in proper form are forwarded to manu-facturers who are likely to be interested in their subject matter

the Reconstruction Editor of the

SCIENTIFIC AMBRICAN In the current usus of the Somer mic American I note the announcement of a new department devoted to reconstruction problems recently started under your direction and wish to extend to you the compliments of civic workers generally upon this far-sigh ed action

upon this far-sighted action

The Municipal Reference Library has
given considerable attantion to the problems of reconstruction and we have comtems of reconstruction and we have com-piled extensive references on the subject. We have recently published a special reconstruction number of our weekly bulletin which perhaps may be of some use in connection with this work. DORSEY W HYDE JR

Municipal Reference Library. 512 Municipal Building, New York City

Wanted: A Factory

To the Reconstruction Editor of the

We note in the SCIENTIFIC AMERICAN of December 14th, a notice on page 485 under head of Reconstruction, to which

e reply We have perfected and patented in the United States and applications for patents have been made in several foreign countries, have been made in several foreign countries, for an automobile non-puncture, non-blow-out, resilient tire. This tire is a process out, resilient tire ready to be manufactured out, resilient tire. This tire is a process product and now ready to be manufactured for the market. We have had sets of tires running on machines since last March and are now making molds to manufacture tires also we have arranged with a tire plant to manuacture under our own supervision tires in a small way until we get into a plant of our own. We are in corporated under the laws of the state of Virginia and have been closely investigated by the State Corporation Commission of this state and granted a permit to sell stock We have not as yet decided on a location for our plant, but have had offers from several cities However we are investigating all places from every source that will be of greatest benefit to our cor that will be of groatest benefit to our cor-poration before we decide on a permanent aome for our plant shipping labor con-ditions etc. etc. Our proposition means much to the community in which it is finally situated We are open now for many situated. We are open now for correspondence with factory firms who may have capacity plants for as industry that is all and more than is or has been expected in the touring car and truck tire world.

Electric Form Lighting Equipment

To the Reconstruction Editor of the SCIENTIFIC AMBRICAN

We are manufacturing an electric farm lighting and automatic electrically oper-ated water supply system on which we have several patents filed. The outfit is the several patents filed. The outfit is the ampliest of far designed for furnishing private utilities to country homes, stores, gans, sawmills, located factories, etc. it contains 40 per cent fewer parts than any of its few competitors and its a Ford idea in its field in that it lends itself to big quantity production and at a marketing price which would underself anything in its field

We cannot begin to supply the demand in one state alone, and due to the adverse manufacturing conditions in the South for manufacturing conditions in the Bouth for producing coupment of this kind, as well as the fact that the resources of a \$50,000 company are wholly insequent for a source for nationalising and handling as Blumans in a big, successful way, we are Blumans in a big, successful way, we are another than the successful way, we are another than the successful way, we are partially as the successful way, the successful way, but a successful way, the successful way, the successful resources and or successful way, the successful way, but a successful way, the successful way, the successful way, but a successful way, the successful way, the successful way, but a successful way, the successf by a big corporation to manufacture merchandise

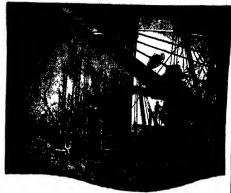

Our product leads itself ideally to his own product some result ideally to his volume production to undersell competi-tion and to dominate its field which is potentially of enormous possibilities and at present of negligible competition. If you care to cooperate with na in accom-

If you care to cooperate with us in our plan detailed information will be sindly

just how numerous poisonous fishes are will be better known when Dr Gudger and these trush their investigations. and the missing their involugations. Far more dangerous to the public, perhaps are our dible fishis which have become infected with minute worms that act as he as arriers of texter bacteria. These

isease arriers go generally under the mitals the nematode is a known carrier of the germ of cancer A government report of several years ago showed that all American trout hatcheries had become infected and that cancer in trout become interest and that cancer in troub was spreading into the fresh water streams and also largely infecting some of the species of salmon. Trout of large bodies of water and salmon taken in salt water were not shown to be so affected. In July and August all species of edible fish perch tass etc in small shallow lakes and slow moving streams are known to be dangerous to cat their flesh being permeated with minute worms

Something like seventy species of fish parasite have been enumerated making langerous for food fishes of sluggish inland water. As a rule fish from deep salt water are most immune from parasites
if butchere I when taken from the ocean Those forms however which pass from salt water through brackish water (mixed salt and fresh) into sluggish waters are true of these fish that pass into streams or lakes infects I with poisonous wastes from factors s or which live naturally in such

Some forms of fish bivalves become infected with the germ of typhoid This has been especially true of such bodies I his been capeually true of such Dodles of factory and sewage polluted waters as Long Island Sound No body of water extant has produced so many cases of typhoid in humans as the soft and hard lams and oysters of Long Island Sound \ good second is Lower New York Bay. reeking in sewage and pollution from factories It is a crimic to allow bivalves from such sources to be sold in the markets The State of New Jersey has likewise had a hard struggle to rid its bivalve industries a hard struggle 1 in dis bivalve industries of the lower Delaware Ray of typhod infected products. The state has been forced to give grate eare to its natural owster beds and to the places where it is allowed to plant seed oysters. Thu has required eulargical police patrol and heavy penalties for infractions of the laws and regulations besides a heavy annual ex-penditure Notwithstanding all precau-tions occasional epidemics of typhoid

Cement Drain Tile

(Continued fr m page 30)

mexperience in the business the use of mixty reacts to lean a mixture too little water or poor methods of curing. As a result the breakage in hauling has in mary instances been altogether too great After the tile have been laid in the ground they should increase in strength and they will not be injured by freezing and thawing if subjected to such conditions as will softburned clay tile. This fact though, should not be used as an argument in favor

should not be used as an argument in favor a four opports made commut tile to poorly made commut tile it is only under unusual condutions that it will pay individual farmers to make their own commut tide. I have are a number of market by means of which it is possible to make first class tile. The process, hourself of the process, hourself of the process of the process of the process. I would not be a first class tile to the amount of the amount of the first process of the process. I would not be a first process to the process of the process

handled and if a good aggregate is close at hand conditions are somewhat altered and it may be economical to attempt the home manufacture of cement tile Again if a large number of tile are to be used and a good aggregate is close at hand one might to buy a large power machine make the tile on a large scale An instance is now in mind in which one fariner paid \$500 for a machine and made enough tile to drain 300 seres of his own land and he still has some 500 acres to tak

In a general sense the practice of taking one s time to construct an article made in a commercial way and on a large scale as questionable. Time is money now to a greater degree than ever before. If what greater degree than ever shorter in what is wanted can be had on the market at a reasonable price buy it. It will usually be of better quality than the homemade product and really cheaper if all things are

onsidered

This question invariably arises in the writer s mind-If good elay tile are to be had why consider coment tile? A well made clay tile will last for a hundred years made clay the will last for a nundred years—
even longer. The average farmer can
better judge the quality of day tile than
of cement tile. He therefore is not so
likely to make a mistake in this respect. If good clay tile and good cement tile are to be had at the same price he will be less likely to err if he chooses clay product On the other hand if the cement tile are slightly less in price and he can satisfy himself as to their good quality he may with econ my choose the eement product good eement tile should ring clear when struck with a hammer The surface material should not easily rub off and it should have a dense appearance and be free from cracks or checks | Here should also be evidence of water marks on the surface to make sure that they were not

mixed too dry
Some cement tile manufacturers make some cement the manuscurers make the claim that their their are superior to day tiles be ause water will pass rather freely through the walls of the the whereas it cann it pass through the walls of a hard burned day the 1t has long been recognised as a fact that little water does or is expected to pass through the walls of a clay tile—it enters at the joints. It has not been demonstrated as a fact that thus characteristic of cement tile is one to be

The Rotary-Pole Magneto

(Continued from page 34) The thing is a manifest mechanical impossibility One remedy consists in mount possibility One remedy consists in mounting several magnetos allowing each to fire its fair share of cylinders at 2 400 or 3 600 revolutions but while that would do very nieely on the ground the added weight is very serious in the air By means of a so called rotary sleeve the armature magneto can be doubled up and made to spark four times per revolution but this is the absolute limit and it is not enough

The rotary pole affords an escape from this dilemma We are here no longer restricted to two or four flux reversals per revolution of the magneto shaft we can have as many as we phase. For the pole may be built out to make contact with the field pieces not morely in a single lobe but equally well in m The wings of north and south pole must alternate around the shaft and opposite each north pole lobe must lie a south-pole lobe Subject to these re-quirements each pole may have as many lobes as we please to give it there will be a flux reversal every time a north lobe

THE MARRIPSONS SO., Boot 51, Mooney 20 ft. Medicon St., Sect. 1985, Soc. Mohest Tell me, without obligation, all about the Magniphone and how it becomes mine.

One more rather conspicuous advantage hundred feet, where the log is attached to inheren in the rotary-pole magneto, with- the main line. Electric motors have no out mention of which our story would be creatests, to speak in eloquent terms when nonaplete. The coil must be wound about they are being overloaded The logging ore through which the flux passes or there is no current induced; so where or there is no current induced; so where the core rotates, the coil must rotate, too. But in the rotary-pole magneto the core doesn't rotate; it is way up in the bow of the magnets, quite out of the field save as the field is passed through it from the field-pieces. So there is no motion of the coil at all

This simplifies the mechanical end of the outfit. When the coil gow round, we have got to pick the induced current off its at its second control of the cont nave got to pick the induced current off it as it shoots past; and for this we need brush contacts and complicated circuit breakers. But when the coll stands still while it produces the juice, we can pick the current off it with the simplest sort of current off it with the simplest sort of

some and complicated moving parts.

Like the sewing machine and the telegraph and the harvester and every other graph and the harvester and every there goed thing, the rotary-pole magneto did not "burst full panpolied from the head of Jove," Jove in this case being embodied in an American inventor, Charles T. Mason. an American inventor, Charica . Mason. There was the basic idea, patented in 1912; and ever since, as in the parallel cases mentioned and in many others, there has been a gradual process of improvement heen a graduat process of which the original hy accretion, for some of which the original inventor was responsible, but much of which was contributed by others. It was the stimulus given, both here and abroad, by the war that lent the final touches to the present high state of development attained by this ingenious apparatus.

Logging by Electricity (Continued from page 34)

Aside from possessing no boiler and fuel-oil tank, the electric donkey does not fuel-off tank, the electric uomacy come ac-differ greatly in appearance from the steam yarder. The motor and drums, of which there are three, are mounted on a heavy wooden side. The main drum us driven by a train of three reduction gears, and has its ends filled with cement to deaden the poise.

The machine is now working at a distance of two miles from the power house A permanent bars wire copper transmission into has been installed to serve the engine. inc has been installed to serve the engine. The power is stepped up to 13,000 volts for transmission, and reduced at the scene of operations by a portable transformer to 550 volts. The motor takes its power through 500 feet of armored submarine cable, which can be laid with absolute safety through mud and water. This cable being wound with heavy steel wire, makes it rugged enough to be dragged makes it rugged enough to be dragged. through the brush, as occasion requires a moved by its own power, by attaching its main cable to a convenient stump or tree. The transmission line has to be extended in the general direction of the change of setting, as the moving radius

To provide for communication with the crew at work in the woods, a signal wire attached to an air whistle on the engine, is attached to an air wheth on the singine, is run out to the point where the load is attached. A boy gives the requisite signals at the direction of the hook tender, by pulling on the wire. The electric logging donkey being far lighter than the steam machine, requires adequate anchorate machine, requires adequate anchorate and the second of the steam of the steam of the steam that the second of the steam of

exhausts, to speak in eloquent terms when they are being overloaded. The logging motor is no exception. It pulls to its capacity and quietly stops. The rigging men, when working with a steam machine can tell from the sound of the exhaus whether the load is too heavy or whether a stop is necessary to adjust the hitch, p thing not yet possible with the electric yarder. Engineers of the company are t work on a whistle arrangement, worked by an electric relay, which can be adjusted to function when the load reaches a preactibed limit of safety

The advantages of the electric machine The advantages of the electric machine, where abundant power is available, armanifold. The electric motor as designed today, constitutes one of the most fool-proof machines in general use. With the use of electricity the problem of piping water long distances to the engine in climinated and the services of a fireman are dispensed with. Added to this comes a marked reduction in fire hazard.

The Return of Our Fleet

(Continued from page 33)

Grand Floet that it dare not leave its harbors. As a matter of fact we are told by Admiral Rodman that the fleet was on Admiral Rodman that the neet was constantly out in search of the enemy, and that small detachments were sent to cruse near the German bases, in the hope of luring the High Seas fleet into the open

But he would not venture out The fleet was frequently under attack

The fleet was frequently under attack by submatines. Says Admaria Rodman:
"In our operations in the North Sea we were frequently attacked by submarines, and our battleships had numerous narrow esseps, often only by prompt and sillful handling. On one occasion a submarine ranmed the flagship "New York," denied the bottom, and demolished the starboard propoller. But there as every reason to believe that the blows from the propeller sank the submarine. En route to drydock to make repairs and install a new drydook to make repairs and install a new drydook to make repairs and install a new propeller, three torpedoes in rapid suc-marines. But again she avoided them by elever maneuvring and escaped. Once when guarding or supporting a convoy of thirty or forty vessels, on the coast of Norway, in mid-winter, a bunch of hostile subs fired six torpedoes at us. Again only our vigilance and instantaneous maneuv ring saved us, but by a very narrow mar-gin. There were still other attacks by submarines which necessitated quick action

"It would be superfluous to go into the details of our operations in the North Sea, or to mention the rigorous climate, where the latitude is north of Sitks in Alaska, or about equal to that of Petrograd in Russia; or the terrific weather, the cold, sleet, snow ice and heavy sens; the arduous and dangerous navigation; the continuous cruising in close formation at high speeds, without lights, where the winter nights lasted 18 hours. Or the dangers of mine fields, our own sometimes, as well as those of the enemy; or the repeated attacks of hostile submarines on our battleships, and the submarines on our battleships, and the never-ending readiness and vigilance of the whole fleet to put to see on all but instant notice.

Always Ready to Fight

et it be sufficient to say that durin our absence of a year there was no other condition than that of constant and continuous readiness for action. There was no liberty or leave worth mentioning; no one allowed away from the ships after one allowed away from the ships after dark, nor for a period longer than four hours, and then only in the immediate vicinity of the ship, in signal or telephone one now the machine as a sendency to vicinity of the ship, in signal or telephone in limit of the ship in signal or telephone or it is all off the ground. A few turns of commission, subject to result. All monitors log or tree solves the question of the solves the question of the control of the solves and the solves are controlled. Another contrivance, as yet lacking on the solvest parket, in a overthead warning selected parket, in a overthead warning selected parket, in a overthead warning selected parket in the solvest parket solves are solved to the solvest parket solves and the solvest parket sol NOT Chance!—High reputation is never the result of chance. Underneath it you will always find the rock-hewn foundation of real worth. In the case of KEYSTONE COPPER STEEL, its high standing has been fairly earned—and has followed as the result of undeniable superiority in actual service.

ener if

Let me add that with all of the demands which have been placed upon the ships of this division in spite of this constant trik division in spite of this constant readiness for action their maintenance, upkeep and officers under war con-ditions with no general overhaul or re-pairs have been maintained at such a high gr c that it is no exaggeration to that were they called upon to do so, they all all attach around the world as they are

now and still be ready to go into action now and still be ready to go into acrom
Ren zzi + the absolute necessity of
lol ling tl German flet innocuous within
its karbors Great Britain made vast additions te her fleet and rounded it out in every branch of its activity Rodman refers to this fact as follows

Io give an idea of the immense size and number of vessels employed in the Grand Fleet it might be of interest here Grand Fleet it might be of interest necestate that catering or leaving port, our column of ships excluding destroyers, was on an average about sixty five miles long, on one occasion 76 miles. Its length was on one occasion 76 miles Its length was dependent upon weather and other con-ditions as well as upon the number of

slips

If the whole destroyer fleet had been in single column astern the total line would have approached 200 miles in length

Ul natriotic and broadminded Americans will be pleased to know that our officers and men who have cooperated with the to the cordial sympathy and high apprecaation which chara terized the attitude of ation which contractined the attitude of our great Ally during the combined oper-ations. I estimony to this effect was given at a dinner on the New York in honor of Admiral Beatty whilin Admiral Rodman

It is truly impossible for me to expres officers of the Grand Heet the pride and officers of the Grand Heet the price and honor which I and my follow countrymen of the 6th Battle Squadron feel for the great privilege which has been granted us of serving for the last year as an integral part of your force under our most efficient genial and well tried Commander in-Chief, and with the others of the British Navy

it is needless for me to resterate that which is known and recognized throughout the civilized world namely that it is the ackbone of the structure which has mad a victorious peace a certainty Without it the war would long ago have been disastrously concluded with just the rivers conditious obtaining from those which now exist.

In addition to indisputably emphasis ing the value and necessity of sea power and the command of the sea the greatest less on which this war has brought home to us is that though we may have been born under different flags and are secredited as belonging to different nations yet these are more a matter of geographic boundary or delineation than of real or important or delineation than of real of important differences and that after all the same blood flows through our veins. We have the same ideals of rights morals, and national blorty and that when the time came to show this to our common enemy, we could not only unite under a sing leadership but could coordinate and o perite amouthly easily pleasantly, with-out the slightest friction and yet have an effected and well adjusted force, ready for any emergency or duty which it impht be called upon to perform

i shall always look upon the year spent in the Grand Heet not only as one of the most profitable but particularly as one of the most pleasant and agreeable of a lifetime and can only ascribe is to the a lindum and can only ascrose as to tose will order develop a variance man instead never ending outcome he had seasistance, of losing his temper and firing him which you our Commanded-in-Chief, and if you are a learner, strive to attend their flag officery, one and all, were ever to be ready to extend to us, parturdistry in the oughly rips, if an employer, take the opening, when we were more or less "third week" into accounts and help the never ending courtes; help and assistance, which you our Commander-in-Chief, and other flag officers, one and all, were ever ready to extend to us, particularly in the strangers to you and your ways, but who, green man

every one seemed happy and contented, if you feel as I do, have become more like and all eager to go to see every time the true and well-truef friends, or even as occasion demanded in the hopes that brothers between whom I trust and believe would most the Hun fleet and en-that the intimacy and affection which has that the intimacy and affection which has been engendered by our mutual association and common cause will last forever afterward

The Crucial Week for the Green Employee

MEN often get discouraged and quit the first month on a new job and do not analyse the cause of their failure. Thus article aims to discuss one universal reason article aims to discuss one universal reason for discouragement and failure in com-mercial and industrial life. A green man often labels himself as "Incompetent because he doesn't understand the nervous readjustment that accompanies any change of occupation, nor does he foresee the crucial moments in this readjustment

Every man in every occupation makes mistakes at the start. This is nothing to his discredit providing lie has profited by them and rearranges his mode of conduct so as to prevent the same mistake twice The man higher up always extends the privilege of making one mistake but wee to the man who continues to repeat it Repeated blundering soon catalogues an employee as incompetent and he is fired or is relegated to some niche of medicere service where his mistakes are not costly

However every man has had a week dead wrong If they all had backbons enough to stick in spite of it this dis-cussion would miss fire but thousands quit—only to swell our vast American efficiency in every occupation there shout the third week that is unques tionably critical?

The routine of new work necessitates the formation of new habits The process of habit formation is as cenentially physic logical as any other function of our ma logical as any other function of our ma-ternal bodies. It lies its basis in the most highly organized mechanism of man—the nervous system. The sense organs, com-ing in contact with the world about us ing in contact with the world about us receive impressions. These impressions are transmitted to nerve centers in the brain or spinal cord and action results. If the message transferred is dependent on the brain for interpretation, the process is conscious if the process is reflex, a lower brain center perhaps the spinal cord handles it with no thought on our part To form a habit is to transfer the circuit to a lower brain center and relieve the higher mental faculties for new work transfer takes place after the same pathway meets no resistance when it excites the

Nervous tissue is very plastic and readily yields to repeated stimulation. But from the time we start to form a habit until it is bsolutely part and pare there are dangerous pitfalls for the indi-vidual. The most critical time is when we must judge whether or not we can trust the lower nerve centers to carry out our work Too much new stimulus forces us to crowd unripe habits into the subordinate centers of control What happens? function inefficiently we make mistakes call these new habits back to consciousn

confusion results and we get discouraged Learning to operate a typewriter, adding machine a lathe a crane, or any-thing else means not only one readjust-ment but thousands—hence the significance of the problem We must not try to let our new habits do the work before they are grown up If an employee can gross this plateau of uncertainty in forming new habits, the battle is half won. If an employer can understand the stress and strain of this period for the employee, he will often develop a valuable man instead

To carry the load and stand the strain

THAT is the duty of axle and shaft in actual services.

Within that great truck there are ball bearings that carry all the strain of the shaft and all the load of the axle—yet they have the added duty of reducing friction

That Hess Bright Ball Bearings serve this way under such conditions makes them standard. And it s safe to say that with a record in such service they will perform as consistently and with as little attention where the load is lighter and strain is less—as on your car

Rugged in strength precise in manufacture, yet certain of performance in gruelling service. That a the testimonist of their worth to you.

Fourteen Months-Half-Hour Shifts-and the G.T.M.

They had never kept belt records in the Kentucky River Mills at Frankfort, Kentucky They always bought expenses belts and took the price as proof of quality. They were troubled sometimes by the frequent need for belt repairs, by their belting bills and by low production—but they just accepted all these things as necessary evils. One July day in 1917 a C.T. M.— Goodyear Technical Man—called It was our Mr Jenkins.

He asked Mr Sutherland, the superintendent, to show him the hardest drive in this particular mill Mr Sutherland wanted to know why The GT M explained the Goodyear plan of selling belts only after a careful analysis of the drives to be served—and not as if a given belt were like a patent medicine and a supercure for any and all lills that drives may entail.

The idea appealed and he was shown the spinning frame drivalt was a shift every half hour the belt was thrown from one driven pulley to its twin. There was one quarter turn and one half turn. He measured belt speed centers pulley diameters and pulley faces, asked about the power and noted the nature of the lead.

Then he prescribed a Goodyear Glide Belt—3½ inch 5 pign.

Mr Sutherland was interested. He asked the price. He found it

was so moderate that he doubted the merit of the belt, but consented to try st. He didn't see where he could lose anything and he might be able to get rid of constant interruptions and shut-downs.

The belt was applied August 16, 1917, and is still running.

Its edges are not seen seen. No stretch has had to be taken out.

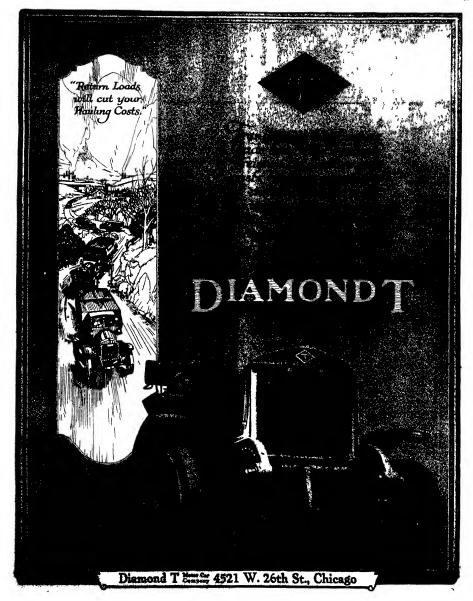

Production has never been interrupted a single minute. Four-teen months after being applied the belt seemed still as good as new

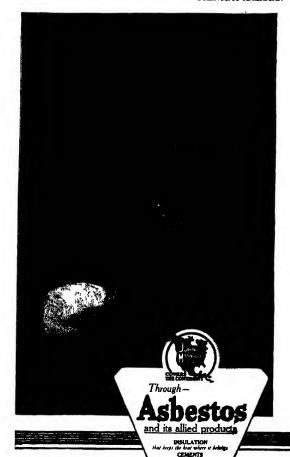

These fourteen months of perfect service, in spite of shifts every half hour on that spinning frame drive, have convected them to the Goodyear plan of beit buying—and to Goodyear Belts. They have made the mill a Goodyear-halted—and G.T M-served mill—his thousands of others.

If you have a hard drive, and have always accepted high beling costs and belt-troubles as necessary svils, sak a G. T. M. to call. One from the nearest Goodyear Branch will be gied to deso when next he is in your vicinity. His servace is free-for the savings he effects for purchasers are so awident and masserial, that a gratifying volume from the plants served is seen to result within a few years.

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO

You can thank these men for some of the coal in your bin

DRECIOUS black diamonds ! . . How we appreciate them since our experiences of last winter. . . .

But few of us realize how science is saving coal for us. We know little of the engineers who have devoted a lifetime of study to successful methods of saving steam and heat: who, through the insulation of piping and other hot surfaces, have worked out great economies in industry.

Not only plant owners but the Government steelf realizes what these men have done. During the last year the Fuel Administration has constantly emphasized in its Industrial work the tremendous importance of proper insulation. And as a result it is estimated that among our mills, factories and power plants over two and a half million tons of coal have been sayed.

And these savings will continue throughout the years to come More will be added to them. For coal wastes of ten years ago will never be tolerated again.

So, for some of the coal in your bin now and in the years to come you can thank, among others, Johns-Manville, who through their laboratory experimenters, by the development and application of asbestos, have perfected methods of heat insulation

And this development of a complete line of insulation has enabled this organization to build up a broader service in heat and power saving than would be possible were that service controlled and centered merely on the sale of any one type of covering Just another way in which Johns-Manville serves, not only industry, but the whole nation.

SEVENTY-FIFTH YEAR (1997) (1997) (1997) (1997)

THE WEEKLY JOURNAL OF PRACTICAL INFORMATION

VOI UME CXX.

NEW YORK, JANUARY 18, 1919

10 CENTS A COPY

An Ingenious Irrigation Scheme

A NEW ZEALAND engineering concern recently conducted an interesting proceeding in the hawarau Gorge, where two pullars had been constructed for the purpose of damning back the water Lach of the pullars is built of reinforced concrete. The column on the right-hand side of the river was

46 feet high and 16 feet square and weighed 720 tons, that on the left-hand side stood 36 feet high and 13 feet square, and weighed 530 tons The spot on the Kawarau where the river is to be dammed back is about to be dammed back as about four and a half miles from its junction with the Clutha at Cromwell, and a few hundred yards inside the entrance to the gorge. The river here is very rapid and asrrow, running at the rate of 300 feet per minute. The hanks are very attern. of 300 feet per minute.
The banks are very steep, and the tops of the pillars were not on a level with their edges. The works undertaken by the Development Company necessitated the rausing of the river. so that even at its river, so that even at its lowest flow it would be high enough to run into the in-

enough to run into the in-take on the right-hand side, and thence flow down a race to the power-house. It was not considered possible to undertake the building of a warr in the suus if fashion, owing to the precipitous nature of the sides of the gorge and the great volume of water, which has a fairly uniform depth of 17 feet. On the pressure of an electric button the gelignito answered at once to the firing of the charge. The huge

mass appeared to apring for-ward and lean slightly over as a tremor ran through its length Momentarily it bung in the air, and then slowly bent and fell with a mighty crash into the river, the spray rising to a height of about 60 feet From the time the explosion occurred till the piliar struck the water was just nine seconds The pillar appeared to give a roll when it again came to view, and the water of the river surged back and then quickly re-sumed its onward flow, cover-The ing the obstruction The pillar had apparently leapt out from its base as the ex-plosion occurred, leaving a gap between its lower end and the bank of about 20 feet. When it came to rest and when the pillar had finally settled, it was seen that it was lying in a diagonal position, its top facing

company's engi to company angular, in being interviewed after a falling of the first piller, present his satisfattion at a way in which it had come and constitution to a part of the piles. which be had allowed for it Since the pillar had fallen the river had risen d feet. It was lying just under the water The intention was to back it up with 1000 tons of mea schiat I has bl ching it was anticipated would sit up finally with sand u d the whole of the river would flow over the obstruction at a sufficient height to

Two monoliths ready for the expl

The concrete pillar toppling into the river

run comfortably into the intake The river being thus raised, the flurang which is built for a distance of 30 chains on the right bank will be available to carry the water to the turbines which are to force the water from the river to a height of 180 feet through 2 240 feet of 30-linch pipes, and thus irrigat's an extensive plantation

Forest Fires of Spontaneous Origin

T is usually assumed that forest fires when not the I result of a strol e of lightning are the result of care-lessness on the part of lumbermen campers picknickers iessness on the part of lumor min campus picknessers or wayfarts A I ruch secontat, Mr G Raymond, demes this and of its several interesting hypotheses in a brief article in La Nature (Parus) to account for spon-

taneous fires He notes first that such fires always occur under the same conoccur under the same conditions, namely, when the weather is dry, hot and windy, as for example, during the blowing of the 'mistral' in southern Europe To begin with, he considers it entirely possible that the dry and possible that the dry and resinous branches of a pine forest might develop enough friction in a high hot wind to strike fire, the case being analogous to the method in which various savages ob-tain fire by a "fire stick" Again, minute drops of resin spherical in form, might act as leases to bring the sun s rays to a focus, thus setting fire to the in-flammable materials around

A third suggestion is that since the ground of a pine forest, covered with needles

and other decomposing matter, ofton acquires a very high degree of heat in the summer months, even a temperature several degrees above 100° F, there may result catalytic (flects in the presence of impalpable resinous

Lastly Mr Raymond considers the effect of a possible nsiders the elect of a possible engendering of frictional elec-tricity in scraps of bark, pine needles, etc, driven hither and thither by the wind It is indeed, a well known fact, that in the right known fact, that in the right weather condutons many per-sons can light a gas jet merely by pointing a finger at it, after shuffing rapidly over the carpet so as to develop a large amount of electricity through friction Similarly the mere shaking of a blanket in the Sabara often causes it to mit a shower of sparks Apropos of this the African explorer, Foureau, often mentioned the fact that during the blowing of the smoom in the desert his amoon in the deart his ponket compass was rendered utterly unreliable by reacon of the electricity developed in its glass cover by the friction of the rand against it, driven before the burning wind Soit appears minerally reasonable to conclude that some, at least of our forest first may be attributed to such causes as these, and that locomotives and emippers and lumbermen my be acquitted of universal responsibility

One of the fallon pillers in the water. Note the intake on the right

To the Secretary of the Navy

N the Sen Stiffe American of December 28th 1918 we made known the very gratifying fact that with th chrimation of the German Navy the United States N 13 3 moved up to second place. We showed also that because our allies lost many of their capital ships and stopped work during the war, upon those they we building our navy is so strong a second that it is equal in dreadnought strength to the next three navies those of Linin Trance and Italy combined

Our investigation showed that the United States possesses 19 dreadnoughts Japan 9 1 rance 7 and Italy 5 We found also that because of the superior gun power ermor protection and displacement of our vessels our 19 ships were fully a mutch for the 21 ships of the three powers enumerated

Our total of 19 completed I mited States dreadnoughts was based on a recent statement of the Chief Constructor to a Congressional Committee that we possessed that number As a matter of fact the Idahe is compicted but has not yet had her trials and the Califorms and Ichnesce are nearing completion and will be finished by the summer. It is fairly certain that all three ships will be ready for service by the time the Peare Plenipotentiaries have affixed their signatures at Versaulles

We are addressing this open letter to you sir, because we feel that you owe it to Congress and the American people to explain why you presented to the House Naval Affairs Committee and allowed to be published in the New York Times the misleading statement of the naval strength of the Allies which appeared in the issue of that journal of December 31st 1918. In the table presented which we analyse on another page you group the completed capital ships under three beads, viz, Battleships Older Battleships and Obsolete Battle-ships and because under the first heading. Battleships you assign 16 to the United States (this being the number of our completed dreadnoughts at the signing of the armistice) it is evident that you intend the American people to understand that the numbers assigned under that same heading to the respective navies of Great Britain I rance and Italy represent the number of completed dreadnoughts possessed by those nations

As the result of your treatment of the statistics the ountry is led to believe that Great Britain has 61 dreadnought battleships completed I raise 20 and Italy 14 whereas the truth is that Great Britain has only 33 France 7 and Italy 5 No that in your effort to convince the taxpayers of the country and their representatives in Congress that our navy is inadequate you give the correct figure for the dreadnought strength of the United States Navy and exaggerated figures for the would make them believe the British dreadnought strength to be about double what it is, and the strength of France and Italy about treble

Now, air, we have a profound respect for the exalted and difficult position which you occupy in these persions tunes, and we naturally and loyally jumped to the conclusion that these glaring errors were merely a slip of So we sought for an explanation of 61 being given as the total of the British dreadnoughts and found that it included the 21 predreadnoughts, or "older" battleships as you call them in your table, and even the 7 obsolete battleships of that navy Now if we add 21 and 7 to 33 (the actual number of dreadnoughts) we arrive at your total of 61. Similarly, we find that Italy has 9 predreadnoughts, which number added to her &

desadnoughts gives us your total of 14

We go thus into detail so that you may understand
our perplexity, for it is evident that you had the full data before you in all its detail, not merely of our own navs, but of those of our allies, and what we are asking ourselves, and what the House Naval Affairs Committee and the country at large will not understand is why the becretary of the Navy should give the true totals in regard to our own navy and incorrect totals as to the navies of our allies

What the American people, naturally want to know is if a battleship is obsolete or old in our navy, why is its counterpart not obsolete or old in the navies of our If Italy has 14 battleships France 20 and Great Britain 61, by the same reckoning the United States has Why, Mr Secretary, do you thus confuse the usue by conveying the impression that 16 and not 30 represents the relative standing of the United States?

With the exception, possibly, of a few of the office with whom you have surrounded yourself at Washington, we find that there is a practically unanimous conviction that the strength of the British Navy is warranted by her island position and the scattered condition of the British Empire, and that it is sufficient that we should be a powerful second Particularly strong is this conviction among the officers of the battle squadron which

Theodore Rossevelt

THE SCIENTIFIC AMERICAN washes to lay I a wreath of mourning at the feet of the great man who has just passed away While he lived, his passionate and fearless nature made him a host of passionate and Justless nature made him a nost of friends and some enimets, but in this time of sorrow all alike, whether they are friends or fore, Republican or Democrats, so him the desire to pay tristate to the man who was regarded as the first American Citizen-and whose laying and patrictim were like and statement to the control of the con-trol of the control of the control of worms, when the control to backless of gooding five tries geariessness and naired of wrong-doing, combined with his fundamental loseliness of nature, endeared him to the generation in which he lived, and will be an inspiration to those which are

you recently reviewed on its return from cooperation with the British fleet in the North Sca

If there is any body of expert opinion that is qualified to judge whether the British fleet is a menace to the peace of the world, it is to be found surely among these American officers, who have spent a whole year with that fleet in the most intimate intercourse and cooperation They frankly express their conviction that the British Navy is regarded both by officers and civilians of Great Britain as a purely protective force, built up and maintained for the sole purpose of keeping open the trade routes between Great Britain and her widely-scat-

Furthermore, the suggestion that the German fleet be sunk was prompted by the belief that an era of retrenchment for all navies, including our own and Great Britain s, was at hand The climination of the German fleet was regarded as the first logical step in this direction

That this suggestion should have originated, as Admiral Rodman has announced, with himself and Admiral Beatty at the German surrender, proves that the thought and desire for retrenchment were already in the air

Now that the public has been made aware of this fact, you will perhaps understand Mr Scoretary, that your persistent advocacy, even before the peace conference has opened, of huge increases in the United States Navy has filled all thoughtful people, not merely among our allies, but here in America, with amazement and deepseated concern

This note of deep concern is sounded in an editorial on your attitude, in the Washington Post of January 3d, which says No patriotic citizen wishes to hear any language at this time, or at any time, which is in its ence a manifestation of distrust of and latent enmity

to one or more of the nations that have fought side by side with the United States against Germany. Yet his utterances along these lines, at a time when Pressie Wilson is straining every nerve to show the Affice that the United States sympathines with them, and is anxious to have them all adjust their interests to the common welfare and peace of the world

Reconstruction-With American Machinery

RIOR to the war, the big manufacturing pro in this country was to reduce the cost of the finished product by means of labor-saving devices for in American goods the cost of labor is always the outstanding item In Europe, on the other hand, where labor has constituted a relatively small percentage of total costs, the installation of expansive labor-saving American machines has never met with much encou agement It was the old story of the farmer and his hogs A silvery-tongued agent had spent a couple of hours trying to sell a wonderful new feeder, which enabled the porkers to get outside a square meal in about one-tenth the time required when it was necessary for them to fight one another back and forth along the trough When he had shot the boit of his electiones his prospective customer remarked, "Waal, I don't guess my hogs time is worth much money

But the war has completely changed the conditions that surround the employer of Europe an labor As a special writer in the New York Evening Post recently pointed out, probably at no time in the history of our relations with Europe has American labor-saving ma-chinery been in such demand as in the present period of reconstruction, European labor conditions, so far as wages are concerned, now more nearly approximate those of the United States than ever before. Already, numerous American makers of machinery who are properly protected in Europe have, within his knowledge, been approached by English and French manufacturer asking them either to ship machinery or to arrange for licenses under their existing European patents

Europe, before the war, did not know what we meant when we talked of quantity production But today new American machines are to be seen all over Great B and, hi less degree, France More important even than this are the American ideas that have taken root-ideas about the layout of machines in factories, ideas about the efficient using of unskilled labor through skilled planning ideas of scientific management of all kinds The great loss of labor through the war alone would snake it essential for the European manufacturer and the European agriculturist to increase their per capital production It is this necessity that is creating a demand for American inventions in Europe, for this country is the headquarters to which other nations must look for inventive development along labor-saving lines

The meaning of this to us must not be overlooked In the first place, it gives great promise of helping the solution of our own reconstruction problems have to do, not with finding enough labor to go around, but rather with the most advantageous employment of the labor which the war will release, and of the manufacturing facilities, multiplied even beyond our normal huge capacity, which it has bequeathed us Our contemporary displays keen vision in its clear view of the possibilities here—possibilities whose importance is but suggested by the fact that already our manufacturers are crying aloud, through these columns and elsewhere for peace-time products to keep their plants busy

The situation has its call to the inventor, too It were utter folly to suppose that labor-saving machinery has attained the height of its possibilities. In every direction it can be improved, in many industries it has not even een introduced save on the smallest of scales. For the inventor who can seize this opportunity and for the manufacturer who will sense it in company with him, the business of developing machinery for us to make and sell to Europe offers extraordinary allurements

To Our Subscribers

OUR subscribers are requested to note the expiration date that appears on the wapper in which they receive their copies of SCHENTIFIC AMBRICAN. If they receive their appears on one wrepper as wmen receive their copies of Scunyrays Assumators. If a will send in their receival orders at least two weeks p to the date of expiration, it will nid un grapely in dering them efficient service.

Engineering

The World's Record for Car Movement is claimed by Columbia, Pa., where according to a recent report of the Drestor General of Railroads, 9,331 cars passed in a single day. In one month 289,000 freight care passed Calumbia, or an averses of six cars for minute.

Gas Producer Built of Concrets Staves.—Owing to the high price and exceedy of steed during the war, a gas company in Syrasuses fortind it is necessary to build the shells of a 200 horse-power gas producer and scrubber out of concrets staves. The shells are eight joint in diameter and the staves measure 34 by 10 by 3-16 inches. They are connected by tongue and groove points Beween the concrete and the fire brick immy there is a three-tunk spece filled with a bear resusting maternal

The Largest Tanker.—What is said to be the largest oil staker in the world was launched at Walland-ou-Tyme last month. The vessel has a length of 506 foot and a width at 68 feet 7 inches with a moided depth of 426 feet and 1 lakerwood system of longitudinal framing and was measured to pesse both the Panama and Bises Canals. The ship's hull-is divided into 13 compartments, and has 4½ mitted of pipper. It is equipped with steam heating apparatus, a refrigerating plant, a hospital and a complete installation of surgitary meaheary. Compound geared turbines are used which may be run independently or be coupled to gearing to draw the proper the stallation of surgitary meaheary. Compound geared turbines are used which may be run independently or be coupled to gearing to draw the propeller.

Caterpillar Road Grader in the Desert .- We have referred before, in this column, to the 17-mile tangent of Lincoln Highway which cuts across the Salt Lake Desert shortening the highway by some fifty miles I his road is being built with desert soil as a base on which is laid a base course of gravel 5 inches thick with a surface course 3 inches thick The descriptions is broken up by means of gang plows and shaped by means of road graders, by naterpillar tractors Owing to the nature of the soil some difficulty was experienced in moist weather due to the weight of the tractors which sank into the mud despite their broad bearing surfaces. The difficulty was solved by bolting tumbers to the caterpillar belts so as to broaden the tread of the machines. As the road bed is completed the gravel is hauled and dumped over it by means of motor trucks mounted on broad steel-tired wheels which serve to pack the road material

Halping the Salvor in the Shipyard—When the roce between the submarule and the shipyard was at its bright it did not seem to notur to anyone that special postulan should be made in the construction of a ship to sender it easier for earlyon to rease the ship it asset should be made. The submarune minner is now part, but awan in me of jeases, there is considerable loss of vessels due to the sements, and to collision. One of the greatest difficulties that wrecking companies have to contend with it that of getting hold of a vessel which is completely as thought of young to the construction of a shap it in necessary to pass chains under it at venous points as there is no provision for stateshing chains directly to the fraums of the shap Wity are not contained with shacking afficient to the fraum members at suitable points so as to simplify and expedite a work of the diver in making chains of called fast to a

Repairing a Wooden Ship with Concrets—A letter from Bance Aires addressed to Engineering (London), describes some interesting work done in the repair of a wooden ship. The venes, which is of 200 tons displacement, was purchased for the transport of stone and man. On dumping stones into the vowel it was found that the bottom was weakened by the fraspect and inside beight Investagation showed that the wooden riba had estirely rotted away for some three fact on riba and estirely rotted away for some three fact on riba and estirely rotted away for some three fact on side was a supplied to the total the wooden riba had estirely rotted away for some three fact on sides edge of the keet The bottom, however, was in good condition. Owing to the condition of the boat it was padged that it could not be decided by remained as the kines. In this encoughor; have ribe of relationed concrete were fitted into the spoos between the wooden ribe and at the kines time ther fashe look was terms phomed by remaining spectaments occupied prices on siber side of it. The words was done in Reful conclidation. The speat gives every evaciance of things a apparent. The congrete adds very little more weight blass, the leadest of did chains which had haveto-fore been quite in the vened

Astronomy

Bright Night Skies in Engiand—The report of the Photographic Section of the Brutah Astronomical Association for the year ending September 30th, 1918, comments on the unusual amount of light in the sky during the nights of that period. It has says the report been peachle to read the face of a watch at all sorts of hours. The contrast of astronomical regatives has been much reduced. This illumination was not due to searchlights, nor did it seem to be aur rail moreover, lighting in towas has been much reduced under war regulations, so the cause remains a myster.

New Ideas in Astronomical Observing.—A committee of the British Astronom of Association is known as the "Methods of Observation Nection This body is trying to make as large collection we possible of special devices and methods that members have found useful in these work, whether in actual observations or in the setting up and adjustment of instruments 1 like director, Mr Maurine A A risk! S Woodville Road Blackheath, London, St. I. would doubtless welcome suggestions from non-members asis as to useful dodges. He proposes to publish short! Information is especially deer in the state of points on which information is especially deer.

The Total Solar Eclipse of May 29th, 1919, will be comparable with the edip so flat summer in the long atretch of continental territory covered by the path the track extends across-bound police as long the path. The track extends across-bound among a to summer widest part, and also across-cquatorial Africa. The duration of totality will be ex. 1 ton illy long (ext seconds or more). The Carages P by partition to ferrestrial Magnetism, Washington is pluning to sind two expeditions to favorable points. In director Dr. L. A Bauer, washes to hear from oil or institutions planning expeditions, in order that arrain, ments may be made for systematic observations in terrestrial magnetism at mosphere electricity, and kim for distances of the clipse

Variations of Mira Ceti Surveil recent series of observations of the varying intuitions of Mira Ceti secompanied by light-curve are published in I 4 streams for last October M 1 this diety the Bidgian startmomer places its last in visuoum at October 2d 1017, with a brightness of 34 mag on the Havaid scale. The previous maximum was November 5th, 1916. The last maximum idd not be observed on account of the proximity of the star to the sum. The increase from mainimum to m visit in was regular and very rapid the subsequent of see see single by other observers to the recent maximum ring from October 15th. The data 1st visuously rakulated was October 21st.

A Short Period Variable Star in Andromeda—
Mas F Mabel Ashall a graduit studint of the University of Toronto, has re nith decovered a variable star in Andromeda R 4 2. h 19 in Ded N 17 deg 22 m, having the remarkall is short; crod of 3 h 50 in 55 i s. The range of vari tons is small being only from about 9 18 to 9 88 in g. This variable was decovered in the examination of a nimber of plates from Harvard College Observator; and a further examination of plates, extending over a period of 26 years made by Miss H 8 Lowyth has re-celed the fact that during 1918 the period of variability changed suddenly becoming longer by 0.17 sec. The light curve above a gradual decline in brightness and a similar graduit measurement.

The Twenty-accord Meeting of the American Astronomical Society was held at Harvard Coiege Observatory August 20th-24d with an atjeudance of about fifty The programme of papers was immusally large, and a considerable number of those deaft with the solar exlipte of last June and the new star in Aquia An active discussion took place over the question now preminent in the astronomical world of the time of beginning of the astronomical world of the time of beginning of the astronomical world of the time of beginning the satronomical world of the time of beginning the satronomical poth at midnight and numbering the hours from 0 to 24 A similar resolution has been adopted by the Royal Astronomical Society, and the project is favored by the British and French navel authorities no the prospects are that the long-mooted referent in time/corping will soon be put into effect. Fird E C Pickering was elected president of the society for the occurs proving was elected president of the society for the occurs proving the coloning year.

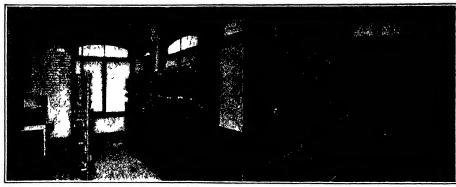

Automobile

Post-War Models in England — There is consider able speculistion in England as to what kind of irrival be offered by the manufacturer now the war is ended for it is a generally accepted fact but the lagners of that rountry have been making careful note 1 to operation of all kinds of earn used by the arranes with a view to future radical changes and improvement a view to future radical changes and improvement work under the last impute and not yet free will hack at that all of the car builders were full up with government work until the last impute and not yet free will inske at impossible to get out any new models for this sous in and the real post-war car is not expected to make its appearance until next fall. Practically the same manufacturing conditions prevail in this country, but no such radical changes in models have but in pedicted here as are rumored for the British makes.

Rubber Water Connections - When cleaning out the radiator it is well to occasionally inspect the condition of the rubber hose connections in the water circula tion system for obstructions not infrequently develop at these places. If a giveenne anti-freezing mixture has been used or any kind of radiator dope, the interior of these rubber connections is very likely to be injured as many of these substances so affect rubber that the interior surface of the connection is softened and loosened and the vibration of the car is liable to cause pieces of rubber to break away When this occurs the loose pieces lodge at the narrow points in the passages and scriously diminish the flow of the cooling water ever one of these rubber connections feels soft and flabby or appears to have breaks in the body of the tubing, the connection should be removed and care fully examined and at the same time the passage should be tested to we that the flow of water is not obstructed

Care of Radiators -Out of sight out of mind is a saying as old as the hills, and as true today as it ever was and it is particularly applicable to the car radiator No one over sees the inside of the radiator and conse quently as long as the outside looks well and there are no terious leaks it is taken for granted that the device is all right and performing its function properly Some kinds of water form a deposit in the radiator and water passages and this is all the greater if the water used is dirty with the result that the circulation is retarded and the engine runs hotter than it should. As the radiating surface is designed in suitable proportion to the size of the engine in order to maintain proper operation the radiating surface must be kept in efficient condition and this means the inside as well as the outside A satisfactory way to clean out the deposits within the radiator is to make up a solution of one pound of washing soda in two gallons of hot water. This is poured into the radiator which is then filled up with plain water and the engine is then run slowly for half an hour, when the soda solution is entirely drained off and the radiator refilled with clean water. This cleaning out should be done several times a year and more particularly where the thermo-siphon system is used

Anti Freezing Mixtures -During the winter season eat care must be observed to keep the cooling system of an automobile from freezing, and to assist in this many anti-freezing mixtures have been offered to owners of cars The U S Bureau of Standards has made an exhaustive investigation of the subject, and its conclusion is that the most satisfactory material to use which will not injure either the radiator engine or the rubber connections is alcohol mixed with the cooling water in sufficient quantity. For a temperature of 27° F a 10 per cent solution of alcohol is required for 10° I' per cent, for -2° F, 40 per cent and for -18° F a 50 per cent solution The best way to make up the proper strength mixture is to use an hydrometer and the specific gravities shown by the instrument for the above temperatures are respectively 0.988 0.968, 0.957 and 0943 Of course the alrohol boils off quite rapidly, and the cooling medium must be tested and more alcohol added every few days but it appears to be the only safe system Glycerine is sometimes added to reduce the loss of alcohol, but in effective quantities it attacks the rubber connections seriously and calcium chloride solutions, so often recommended are decidedly corrosive especially on the soldered joints of the radiator and on aluminum or alloys that are often used in manifolds, pumps, etc

Two views of the multiplex apparatus now employed for increasing the carrying capacity of telephone lines

Getting More Messages Over Our Wires

How the Traffic Capacity of Telegraph and Telephone Circuits Has Been Increased Three-fold

THF new system of multiplex telephony and telegraphy recently announced in the daily press is the result of soveral years of intense offert. By its application it of soveral years of intense enter 133 its application it is now possible to increase many fold the message-carrying capacity of long distance telegraph and tel-phone lines indeed the new system marks an epoch in the development of trans continental communication

the development of trans contineintal communication. The new multiplex system which has been in actual use between Baltimore and Pittsburgh for more than two months with entirely satisfactory results is the recent practical application of the work of the technical staff of the Bill Organisation. If permits four telephone con versations to be carried on simultaneously over one pair of wires in addition to the telephone conversation provided by the ordinary methods. I hat means that over a single circuit a total of five telephone conversations are simultaneously transmitted and in each the service is as good as if the circuit were carrying in the ordinary way, a single conversation

A number of years ago the Bell engineers developed A number of wars ago the Bell sugmeers developed the 'phanion' curvuit arrangement by which telephone circuits are obtained from two pairs of wires and and has been extensively used but here tofore it has been impossible to carry over a single pair of wires more than one telephone conversation. Now it is possible by the multipex method to utilise many charge of barts for five conversations while two

pairs of wires which heretofore had a maximum of three conversations with the aid of the phantom may now be multiplexed to carry ten simultaneous conversations This amounts to an increase of more than three fold in the telephonic carrying capacity of the wices as compared with the best methods previously known to the art and an increase of five-fold in the capacity under conditions where the phantom circuit is not employed. The new multiplex system makes use of alternating

currents whose frequencies occupy a range b tween the frequencies of the ordinary telephone currents which are those of the human voice and the lowest frequencies which are used in wiseless communication. This frequency range has not introtofre been commercially used. It is interesting to note that under favorable used it is interesting to note that under favorable conditions the whole range is suddile to many and the lower part of the range is suddile to anyone with normal hearing it is found that frequencies within the range are high enough to be used as 'carriers of ordinary telephone currents and yet with proper arrangements telephone currents and yet with proper arrangements can be transmitted over long telephone lines without the large transmission losses and large interference between curcuits which would be it ught in by higher frequencies. Each additional curcuit in the new system makes use

Each additional circuit in the new system make size of some frequency within this range. At the sending end of each circuit the or linary telephone currents are made to modulate this 'carrier' frequency so that the amount of the "earlier" frequency art out on the line varies with the amphitude of the ordinary telephone current. At the receiving end the carrier current is put into a demodulating circuit which then gives out the original telephone current.

The different circuits are kept separate at each end by inserting in each circuit a combination of impedances which make up an electrical filter. This transmits which make up an electrical filter. This transmits the range of frequencies peculiar to that crown and stops all other frequencies. An important difference should be noted here between this system and writeless systems, in that in wireless working it has been generally sufficient to send and receive in "dignet circuits I he multi-plax systems, however, suned circuit would not be sufficient since each telephone channel occupies a range of frequencies of about 2,500 cycles and any circuit uned to these comparatively low frequencies would be too selective to receive such a range property.

vacuum tunes are used in the modulating and de-modulating currents and are also used as amplifiers in the transmitting and receiving branches and at inter-mediate points along the ime where necessary, in order to prevent the currents from becoming too highly at-

renutated The underlying principle may be illustrated by considering a composite photograph of five individuals. Given such a composite photograph of the ordinary size it would obviously be impleasable to derive from it the picture of each of the five individuals going to make it up in the owner of the composite photograph had been made in the composite photograph If however the composite photograph had been made up in five different colors, the picture of each individual up in New different colors, the picture of sach individual bung in different color, say, one ed one blue, one green, one yellow and one violet, it would then be possible by looking at the picture through colored glasses, to see any one picture, separate from the others if red glasses were used, the picture practice in red only would be seen, if blue glasses the picture in blue, and so on although when looking at it in the oglainary way all of the pictures would be seen together and only the combination would appear. As the tint of each picture serve as a means of differentiating if one has the other differentiating if one of the other differentiating if one of the delay of the color of

of the "carrier" currents serve to differentiate such of the conversation in the sew telephono multiplex. Sensational results have also been attained in telep-aphy by the new multiplex system A single pair of wires combined into a megaliic circuit of the type used for telephone working, by the appheation of the Bell Systems new apparatus and methods, will have an corrously increased expectly for telegraph messages. As applied to high speed printer systems, the organeers are the server of the system of the system of the server are the server of the system of the system of the system corrowed results are attained without in any way un-pairing the telegraph traffic.

pairing the telegraph traffic.

Moreover, the nature of the developments permits
the same wires to be used partly for telephone and partly
for telegraph purposes. This means that a pair of wires
as available either for a ve simultaneous telephone com-

as available either for We's multianeous telephone con-versations for 60 simultaneous telegraph messages, or partly for one and partly for the other. There have been aumberless attempts by inventors, scientists, and engineers, from the earliest days of both the telegraph and the telephone, to develop methods for

the multiplex transmission of messages Dr Alexander Graham Bell was working on the problem of multiplex telegraphy when he had his first conception of the structure of the original telephone I be significant that the Bell organisation which has been and is working con-tinuously to perfect the telephone and extend its useful-nees, has accomplished not only multiplex telephony but multiplex telegraphy, Dr Bell's unsolved problem Notwithstanding the fact that there were no on

clustedly practical results from the early efforts in this direction it is nevertheless true that some of the underdirection it is nevertheless true that some of the under-takings of the scrifer workers in this field have been of suggestive value at least in the working out of the prob-lem As an instance there is a suggestion made by Major General George O Squier, Chief Signal Ufficer of the U S Army, about ten years ago, which attracted very general attention Likewise, Dr. Lee DeForest working in entirely different fields and with a different

working in entirely different fields and with a different objective, a number of years ago, invented a wireless device known as the audion, which by the improvements and adaptation of the telephone engineers has been made an important part of the new system. Whate the new multiplex system is physically adaptable to short lines, practically, from the nature of the apparatus and methods employed, it is not advantageous on lines of much less than one hundred mides. On longer lines its application will be extended immediately, but its introduction must necessarily be gradual on account of the nature of the apparatus required and the rarrange-

its introduction must necessarily be gradual on account of the nature of the apparatus required and the rearrangement and salapiation of the lines themselves and thair associated apparatus to the new methods of working. The new multiplex system as it is now applied to the telephone as a means of increasing or multiplying transmitting capacity of long lines, requiring no change in the subscriber bisphone or in the terminal switch-board operation It is quite as applicable to transcribe the contract of the c

The "Eagle" Boots

The "Engle" Bests

THE Ford 'Earle" boats, of which we are hearing so much just now, were designed for sati-submarine service—work for which we have always considered as larger crist, and we believe that if nor services that it is not structors had had their way and been left estirely free in the matter, they also would have designed a larger boat with better sea-leeping qualities. How far lift Ford had to do with the design we do not know, but we do know that speed of construction was a controlling consideration. Remore the franking and the general insecunderation Remore the franking and the general insecundant working to a minimum. They bound a general working to a minimum. They bound a general working to a minimum. They would be in trouble driving into a head was or running before a following sea, in which latter case they would be very difficult to steer Ether the construction of any more of these boats should be a bathough of the design should be these boats should be a bathough of the design should be minimum.

What Machinery Is Doing for the Walnut Industry

How Production Is Enlarged, Prices Stabilized, and Wastes Eliminated

By Howard C Kegley

A FEW years ago when the English walnut growers of California formed a cooperature association and began marketing their own product they found a big obstacle in their way. That obstacle was the cull—the under-developed, discolored or scrawny nut. It stood in the way of standardisation of two coccilent grades. The people had been secusion it to walnuts at 10 cents per pound, and they couldn't so that any auti was worth more than that. Nut peddiers had been in the habit of buying up quantities of culls, topping them with a few high grade nuts and

promise, togenore them with a for onlying an quantous profiling the marced with them At the outset the growers' association decided that it would have to eliminate the cuil in order to prove to the public that there was something better—something worth at least 23 cents per pound 8 to the first year of scientific marketing the cuil was taken off the market 1 had previously been sold at about five cents per pound At the outset the association undertook to crack it and sell the meat for use in candy stores and bakeries. The going was a little slow and the cuils died a pan out profitably the first year but the first and second quality nots brought good processor.

areful study of conditions and requirements have at the outle business on a bigger scale, so the contracts were made to read that all gowers had to deliver their entire output of outle to the amount of their entire tuning taking the call out of the market. Fine members of the semiouslin intended their machines when the semiouslin intended their machines when the semiouslin intended their machines when the semiouslin intended their machines which did sway with hand-cracking, provided as match of separating the good nate from the bad once and finally made it possible to extract the last more of mast from the shell of the cracked culls.

of mast from the shells of the cracked culls. Today the walnut growers association has revolutionized its business to the point where it gets from 20 to 23 cents per pound for number ones and number twos, and sells its nut meats for from 2 to 45 cent per pound. And the singular thing about it is that it cannot get acough of the meat to supply the mand. This is due to the fact that the meat of the English walnut grown in the United States splumper and the supply the substitution of the self-should be supplyed to the substitution of the subst

English walant grown in the United States a plumper, ranger and whiter than that of the nuts grown in southern Californs whould meate completely enveloped the imported walant meates completely erowded the imported walant meates cut of the market in that country. The invention of the three machines used in transforming the cull into an article who is in big demand and it possible to use every bit of the cull for commercial purposes. In the packing houses of Chicago it is said that they extract from the pie overything but the squeal lith speciformance. Even the shells are sold, they are used in place of commend, as a carrying whole for dynamic and the association soils all of its oull shells at \$10 per ton. In the matter of winning

Vacuum machine that culls out the undersized nuts

This machine cracks but does not crush the nuts

the war it can be seen the English walnut has done its bit along with other products of the soil which are considered more vital in times of war

Trobably the most important of the mechanical mechanical advice most important of the mechanical machine—a divice invented by our of the association immbers and sold to the organization. It has a capacity of five tons of nuts per day and four of the machines keep 200 women and garlas twork separating the meats front in this file and grading the measts.

Ins machine has a nut hopper at the top. The nuts drop from holes in the bottom of the hopper into cylinder going in one at a time. He cylinders feed then one at a time in between long iron hingers. The finger device is operated by cam wheels. At one stage of the crucking operation the fingers are just far enough apart to admit a walnut with its end perpendicularly. When the walnut has dropped between the fingers until it fits anugly the cam wheels turn around to the point where their leverage aboves the right hand set of fingers over against the left hand set with a quick motion and that motion exerts just enough energy to snap the shells of the nuts without exercising any slow pressure which would tend to punch or crush the nuests. Then as the came in nover against the fingers are allowed to spread apart, and the nuts drop into sacks which are hung over the mouth of the chuts below the machine.

The adjustment of the machine is so nearly parfect that it cracks at least 55 per cent of the nuts without injuring the means in any way. The 15 per cent of damaged meats come from extra large or unshapely nuts which do not conform to the size of the space between the cracking fingers and consequently get too which returns the time meahing is in motion.

octiven the cracking angers and consequency get much squeeze when the machine is in motion.

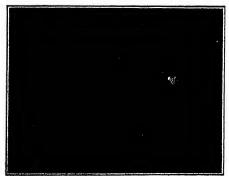

One of the laggest problems that confronted the association when it undertook to separate the culls from the high grade nuts was that of weeding out the high weight—the nuts with only one mature half, or those which had shriveled meats or moldy meats, or were otherwise unfit to go into the two best grades

It was necessary to eliminate these inferior nuts in order to establish firmly the quality of the better grades in the open market

This difficulty was overcome by the use of a vacuum machine invented for that particular purpose. The device works on the pimuple of the vacuum cleaner, and it life from among the high grade nuts all nuts which are light in weight and therefore of questionable quality. When it has finished its work the association is reasonably sure that every nut it has left in the two best grades is a sound nut with plump meat. The nuts are conveyed to the vacuum machine in

The nuts are conveyed to the vacuum machine in a narrow elevator at one side of the machine. The elevator belt is pooleted to keep the nuts from piling up and overflowing the elevator track. When they are dumped into a trough at the end of the elevator.

Feeding the shells into the machine which finds the small pieces of meat that the girls have everlooked —fifty dellars' worth a day

This sketch shows what will be the comparative strongth in dreadnoughts of the United States, Japas, France and Italy at the signing of the Versalius Peece Treaty, when our dreadnought fleet will be equal in power to those of the next three nations

Battleship Strength of the Five Leading Naval Powers

Analysis of the Standing of the Allied Navies in Dreadnoughts, Predreadnoughts and Battle-Cruisers

THE end of the world war finds the Allied powers war-weary and eager for relief from the burden of main taining huge armaments both on sea and land. Americans returning from the other side, whether they be officers of the army or navy or civilians tell us that all of our allies now that the Oceanan threat is gone are prepared to make a provata reduction of their armaments based upon their several national necessities and it is confidently believed that the determination of the relative future strength both on sea and

land, will be mutually and ameably ad

man, will be mutually and amarabll ad justed at the forthcoming is a conference in 1914 the leading naval powers were in the full swing of that but dissource com-petition which the aggressive activity of crimany had imposed. I very leading navy had an important program of nivial construction on hand and in 1914 the construction on hand and in 1914 the construction on hand and m 1916 the United States also forescenng the possi-bility of its eventual entrance into the war, only or its vectorial thrance the war, sanctioned its a single program an addition to our fiet greater than land over been voiced by any naval power in all the history of naval shipbuilding. Fo Great Britain was assigned the task of holding within its histories or defeating in the open within its harbors or deterring in the open the powerful German fleet and with a view to providing for future losses and making sure of having at all times a sufficient proponderance of power in the North Sea the British shipbuilding yards, both governmental and private were in structed to rush the uncompleted ships

of the 1913 and 1914 pr grams to completion

The other members of the I night France Italy, and Japan, realising that they were sufficiently strong in battleships and buttle crossers to take care of the fleets of Austria and Turkey practically ceased all work on their capital ships and concentrated upon unarmored ships of the scout destroyer and aubmarine type. All of the Allied navies particularly that of Great Britain, suffered heavy losses during the war Great Britain has

lost two dreadnought battleships, eleven predreadnought battleships three battle cruisers eleven armored cruisers, crusers, two second-class crusers, eight light crusers, and over forty destroyers
France has lost a semi-dreadnought battleship, three predreadnought battleships three armored cruisers, a protected cruiser, and cight or ten destroyers Italy has lost one of her finest drendnought battleships three predreadnought battleships, and half a dozen destroyers. Japan is short an armored cruiser, two light cruis-ers and a destroyer, and the United States has lost an armored cruser and several des-

The lifting of the censorship makes it possible to give in detail a statement of the detail a statement of the present strength of the navies of the world and to include a this the new ships which have been built during the It should be noted that because of the limitations of space, our tables ou the accompanying page include only capital ships, that is dreadnought battleships, pre-dreadnought battleships, and battle-crussers

The British Navy

At the date of the signing of the armistice, the battle-ship strength of the Beitish navy consisted of 33 dread-nought battleships, 21 predreadnought battleships, 7

obsolete battleships, and 9 battle-russers. For reasons best known to himself, Mr. Dennes, Secretary of the best known to himself, Mr. Dennes, Secretary of the Committee, credits the British nay with no predread-noughts or obsolete battleships, but lumps all three types together as dreadnought battleships. The capital ships completed during the war and included in the Circum Frest convex of three dreadnought

battleships, the "Benbow, 'Emperor of India, and

"Mariborough," of the "Iron Duke" class, ships of 25,000 tone, mounting tos 18 5-noh guas. Also, the "Aginocuri," a ship which was laid down in 1911 at Ellswick for the Brasilan government. In January 1914, she was sold to Turkey and on the outbreak of var, being still in the builders' hands, she was taken over by the British newy and named "Aginocuri". She is guist in seven 3-guist in seven 3-

wick, for Chile and thown as the "Alminate" or armamant consists of ten

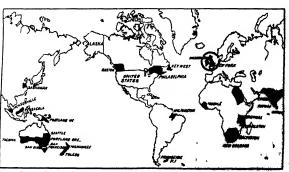

14-inch gua.

Of the five shape of the "Quoen Elizabeth" class of 27,500 tons, mounting eight

15-inch guns and steaming at 28 knots

Narpite were about completed at the
opening of the war and three others, the
"Vallant," "Barkam," and "Malays,"
were put in commission in 1915

They mount the same battery of sight 18-inch guns
Contrary to the general belief, Great Brata did not
build many new battle-crussers during hostistes. As a
matter of fact, only two, the "Repulse" and "Renown,"
were completed and joured the the Greand Fleet. They
are the longest and largeth warnings aboat, with an
orderal length of between 500 and 500 teek, a displacement of the complete of th

Geographical conditions under which the United States would require the most sewerful floot in order

of anti-unbmarine craft, we made a great increase in the strongth of our dreadmought first between 1914 and 1918 by the addition of sevien of the largest and man powerful ships in existence in 1918, we completed the Oklahoma' and the Newada, 27,400 tons, nounting as their man battery ten 14-inch guns The following year we completed the "Fennivytania and "Arsona of \$3,500 tons, cach mounting twelve 14-inch guns

Great Britain

These were followed in 1918 by th. New Mexico and 'Massianppi,' of 29 000 tons not twelve 14-inch guns ready by the summer. So that by the time the peace of the year and was ready to us draps he trais. In addition to these vessels we are building two more of the New Mexico class a mely the (altierum and Tennessees which will be of abrut the same displacement but will mean city the same target and the peace which will be of abrut the same target and the restaining rates as larger the

re late in of the military leaders among

In the troad field f engineering also in the troad field (inguneering also we showed climater set entroy and it sourcefulices particularly in the provision of ducks yards at rago in issees and in the reconstructual of the music railway system, which was allotted to us for the servial of our army at the first.

Even in the matter of million service although earlier were all will compare.

athough results were of sirjus service although results were six in coming we were beginning to sujjly our lighting forces at a very rapidly interesting rat and with promise of a huge air free if the war had carried on tuto 1919.

But in the matter of artillery and particularly and particularly

and particularly the licavy artillery w were up against a high problem wil ch in the very nature of things required time for its solution. Rifles can be probled d in great numbers at comparatively si rt notice machine guns also although requiring of requiring of the can be prilied at a comparatively rapil rate when once the plant is installed. When we come to field artillery however the task be one a more serious and the time element is the con trolling factor. It is known that our army had to dopend in the first months of

arm) had to depend in the first menths of our active service upon the French gun factories which fortunately were in a position to give us the artillery we so im-peratively needed. But when it came to the question of im-mediately supplying heavy artillery we were up against a situation—depite even our wast resources in taw materials. steel works foundries machine ships and skilled mechanics to say uothing of a plentiful supply of capital—which required time for its full solution

14 inch raliway mount Gun is wire wound Shell 1 200 pounds Velocity, 2,900 feet seconds

16-inch howitzer under camouflage screen at the front

war sollege general staff, and such of our leading generals as were withing, in their patriotic desire to avoise the country to the serious-ness of our lack of artillery, to risk the wrath of the icians sounded the warning for many a year previous to the war We have only to instance the case of General Leonard Wood who General Leonard wood who several years ago as Chief of Staff and persistently after the great conflagration broke out in Europe warned

us that we could not ibly extemporase artillery, either fiel

sitily octemped as the second of the control of the

nong-range gume of 12 and 14-inch caliber on massive railroad mounts designed for the shelling of the back areas of the enemy country far behind his front, attract most attention

m-inch Railway Mo

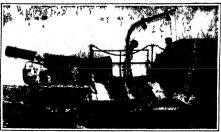

First among these is the army 14-inch high velocity gun on a railway mount

Permits all-around fire. Maximum elevation, 65 degrees. Total weight, 177,900 pounds. Shell weight 780 pounds. Velocity, 1,500 feet seconds. For strange fire against dupouts, cament shelters, stc. 12-inch merter railway mount

Eight inch howitzer on caterpillar self propelled carriage Speed 1 to 4½ miles per hour

This mount was designed prior to the beginning of the war It was intended primarily for the mobile seasonat defense of this country and of course, was admirably adapted for service with our armses in Prance. Cun and cradle are mounted on a heavy sell-plate garder the entire mount weighing about 200 tons. The gun is wire-wound the eabher is 14 inches and it is 47 feet in length 1 if frees a 1 200-pound projectic with 400 pounds of powder, with the high mussile velocity of 2,000 larger way of the country of the c This mount was designed prior to the beginning of the

the gun is returned to bat-tery by counter recoil springs The gun is placed in the firing position on a cast-steel bed plate, which is adapted to give the mount a traverse of 360 degrees Abou five hours are required to place this mount in position using a well-trained crew The rate of fire is one round every two minutes and the mount has the ad vantage of being adapted for ransage of Deing adapted for use against moving targets such as battleships as well as for use against stationary targets on land

Twelve-inch Sliding Railway Mount

Another type among big guns is the 12-inch sliding railway mount. This has no recoil mechanism the recoil being absorbed by friction produced by sliding the mount on the special treak which supports it. It is operated on a curved track and is trained on the objective by moving the mount backward or forward. The entre mount is 105 feet long weighs approximately 600 000 pounds and is carried on four trucks of eight wheels each pounds and is carried on four trucks of eight wheels each it has been moved on railway tracks at the rate of 40 miles an hour. This 12-inch gun is 50 feet long at fires

a 700 pound projectile with a m zrie velocity of 3 200 feet per second (the highest v i ty for a big shell of which we know) and with a r gc of appr ximately 28 miles. The mount was bill it cordinance Depart-

which we know, and will a r gc of appr sumately 28 miles Tho mount was bill it of Ordnance Department with the exception of the gui itself it 85 days After the track is laid and be n siringers placed only about five maintes are rejured to n sw the n cunt into position and get it ready for firing and it may be

he must now depend at times upon men unused to making such his to wheat from the 138 standard combination sizes the proper size for each man and do this without loss of time the need of a simple machine is evident. I urthermore upon a compila tion of the tariff of sizes used in the many organi tions the Quartermaster Corps must depend also for tions the quartermactic Corps insula depend asso for its final tantiff for ordering from manufacturers. The much needed machine in addition to saving time matter acturacy of fit to each solder and a correct tariff for subsequent ordering. In a desire to make haste in supplying the recruits with their service shoes upon their arrival at the

training camps commissary officers and their as sistants found it necessary under former conditions to allow the recruits in many cases to specify the sizes they should wear and in some instances the new soldiers were permitted actually to pick out of sto k the sho s in which they received their initial training. This cardless matter is no longer allowed because recruits from civil life do not know the sizes of army last shoes which they should we ar in pre-paring for and participating in actual warfare. In

vestigations made at a number of the concentration camps disclosed the following characteristics I Ignorance of their correct foot sizes even in civilian

2 Instrance of the difference be tween their see in civilian footwear and the corresponding use in army shoes 3 Ign rance of the matter of making proper allowan e for foot-xpansion in the arms she produced by hard marching and the carrying of the solliers fighting equipment. 4 Personal vanity as shown in a desire to wear as small a size as possible

district to Warf as sing as possible.

And it is well known by now that solders must wear properly fitting shoes. The human feet is a fragil stricture exitaining 26 small bones of irrigular shape. These small bones must be kept in their proper form and place to ensure effected. locomotion Again feet troubles gener ally lead to leg troubles and a soi her who is impaired in his lo in tion is no longer a good suldier. Hence the importance of properly fitting shoes is a paramount con sideration in any efficient aimy

It has remained for Mr I limer Jared Blass the president of a leading shoc orm pany of Boston Mass to color satisfactory army shoe fitting system. His principal aim in devising his system was to chiminate, so far as possible the likelihood eliminate, so far as possil it the likelihood of matakes being made in set imp shor sizes for the soldiers. It was believed that having got each new soldier right on the spot at the time of his entrance into the Army, and having disablesed him of the idea that he limited was to exercise any jurisdiction over the selection of his service shows, the new system of his service shows, the new system of

Length detector used to cotain size of shoes when markings are defacted, developed by Reclamation Department overseas

that would correctly provide for the 138 different com-binations of sizes and widths required by the complete size-range of enlisted mesi-and yet be simple enough in

Kit or carrying case containing the fost-measuring and shee-fitting devices.

rger than the bottom of an adult human foot, which is the foot-measwhich is the foot-measuring device, and a set of thin metal blades, each fitted with a metal knob on one end, which is the shoe-fitting device. The larger or measuring machine translates the foot length and width into the shoe length and width The set of blades compoung the shoe-fit-ting device is employed to prove the accuracy of the size as disclosed by

easuring the soldier s feet in the larger machine. The measuring machine is constructed for the great a ne measuring machine is constructed for the great army of average feet—that is, feet that present no marked abnormalities. The elevation of the heal por-tion is of scientifically correct height for positioning the human heal when the foot is measured for the the human heat when the foot is measured for the army shoe. Fin angle at which the side wages are set was determined from a composite of the angles of the army time in the army discrease. The adjustment of the mechanism governing the opera-cian of the postate on the width-scale by the spread-ing action of the side wangs, was also worked out upon a sometitle base.

The precedure of measuring is as follows:

The measurer requires the solder to remove his old above, put on his army pack, hold his rifle, then measuring machine, with the heel back mugy against the ourred blook at the back It is essential that the foot be in the center line of the machine, that is, the singuiary health through the center of the foot from heel to toe should be over a similar line on the bottom of the machine.

the notion of the machine.

The measurer then releases the wings at the sides and allows them to press in against the sides of the solidier to foot. He also slides the plunger, at the front of the machine, along until its flat end

rests lightly against the end of the soldi

foot
Then the soldier, keeping his balance by holding onto some sort of brace above, rises times on the ball of his foot. Pits act of rising closely duplicates the act of rising closely duplicates the act of walking, and, since the soldier is carrying his expulsion service food, the weight thus put into the spread of the foot when the part of the present of the foot when the present of the present of the foot when the present of the present of the foot when the service of the present of the foot when the service of the present of the foot when the service of the foot was the service of the foot when the service of the foot was the service of the foot when the service of the foot was the service of the ser

asour sail as such off the device. The resulting spread of his foot, for as well as sidewise, thrusts the st plunger forward so that its little mapoint automatically againster the so shoe length; and this two side edem

point automasseasy super-side length; and the few used very show longth; and the few used in threat apart so as to assue the erro-pul-on the interest cash to record autometic the correct show which as A, B, C, sho h, his so to of risking several times (the ball of his foot, the neighbor from the forth. seadquarters workers. To dighter these work and make it comparatively easy, a Cincinnati man kit upon the Red Cross stretching of the strength of the strength

Other Red Cross workers are hereby requested to 'steal" the idea and make wheels like it

The Current Supplement

THE study of the wonders and the mysteries of our sarth offers endless attractions to the student and the scenarist, and many of its problems are of the utmost sconomic value One of these problems that has not seen definitely solved relates to The Aps of the Barth, and he paper having this title which appears in the current seus of the Schemyric American Supremark, No 19246, for January 18th, will be found of more than reducery interest to the general reader. The task of manfanning an army in the field is infinite in its unifications, and on its seccess depends the results of the content, fully as much as on the actual righting and even more so, as without adequate supplies no anaying photographs, tells not one of the ver present problems confronting those schild the fighting lines, which is far eaching in its effects. The final intalment of the papers on The Mozoo advance of Versanels, with a large number of unusually interesting photographs as

urmy could exast "water for an Army, maying photographs, tells of one of the over present problems confronting those rehind the fighting lines, which is far eaching in the effects. The final instanct of the papers on Ta Macco additional tells of the papers of the of th

A Model Hospital on Wheels

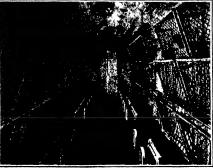

FOR the rapid and proper transportation of our wounded in France, there have seen built in England a number of hospital raises. To be more specific, the hospital raises To be more specific, the hospital raises have been built at the works of the least Central Railroad of England at Duknafield, and it is perhaps safe to say hat these trains are the last word in the ransportation of wounded.

The accompanying illustrations give

A Cincinnati man invented this stretching wheel for simplifying Red Cross work

some idea of the ward ear of the American hospital train, which is fitted with every modern appliance for the confiort of the wounded near during long pourneys Each train carriers a large Red Cross and the letters U S as well as the train number. There are accommodations

With its beds raised, the ward car can be quickly and thoroughly cleaned

for both lying down and sitting up cases as illustrated. The train also includes a kitchen car and a coach for at tendants.

New Way to Make Castings of Non-Ferrous Alloys

A PROCLSS for forming easings of extrain nonproporties on the notal is an smoothly a New York regime ring company here's companions are not trees in a notal by the second of the companion of the trees in and Parts made by the process are said to possess greater tends strongth increased density and to be free from blow holes their crewtalline structure, and to be finer and the machining qualities superior.

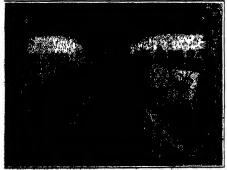

The new process consists in jointing the molt in allows into motal molds and forming or congoling them ander pressure. They are really discussings formed under high pressure. The inventor claims that the process gives absolute control of the desired physical properties and the machining qualities. A very large number of fuse bodies for shrapisch have, already been made by this process. The composition of these is 80 per cent aluminum and 20 per ent zine. It is claimed that almost any grade of non-firming salley.

It is claimed that almost any grade of non-firms alloy can be handled by this process the easting buring made in a specially constructed variomatic machine by which a large number can be postured in a day. Besides a 90-10 aluminum cupper alloy there has been inaide one of 80 per cent cupper and 40 per cent zinc with a trace of kad baving a femile strength of 49-900 pounds per square inch and an elastic limit of 20.750 per cent in two males. Another almost almost almost almost almost almost almost almost an order and 15 copper is reported to has a tensel settrength of 42.700 pounds of the strength of 42.700 pounds per contract and the strength of 42.7000 pounds per c

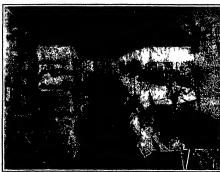

p i cent rine and 15 copper is reported to have a tensile strength of 42 700 pounds per square inch and an clastic limit of 29 400 pounds per square inch with a definite clongation of seven per cent in two inches

man interesting feature of the process is the possibility of making as alloy of ulunum copper and trou which has a low coefficient of expansion. Success is said to consent in a special secret method of in troducing the from into the mixture. The ordinary piston made of aluminum and copper is said to have tree great a coefficiant of expansion but the introduction of the trous is regarded, we making it possible to the control of the control of the consention of the control of the consention of the control of the c

One of the many advantages claumed for this process is that important parts of artiral motions can be made of great strength and lightness. In the case of pistons the stringth can be put into the head and the can be machined down to lighter weight and still possess unusual strength. In process has been patented in the United States and in Great Britain, Japan and other foreign countries.

A want our property for both lying-down and sitting up cause

For the handling of lying-down cases, all the bods of the ward car are prepared

The Service of the Chemist

A Department Devoted to Progress in the Field of Applied Chemistry

Conducted by H. E. HOWR, Chemical Eq.

Federal Aid for Research

FROM a priliminary consideration it would seem possible to defend the general proposition that our terms consideration it would seem possible to defend the general proposition that our content consideration is desirable to the consideration of the consideration along lines which would doubtless have remained un-touched for many years had the investigations been left for those most interested in the results. Our farmers are not alone in this cititude for it might be shown in litigation or threatened law suits much of our brilliant industrial research has had its inception. I rue agriculture, in common with other enterprises, profits from most of what is done to the manufacturer slabor atory but, likewise the factory gains when agriculture advances and this is simply further proof if it were needed of our interdependence in our complex civiliza-

While the agricultural experiment stations have not always been managed to suit every one and some may even consider many of them failures some of the results have been of the greatest value Consider what has en accomplished in improving strains of corn oats and wheat and what has been proven with reference to seed selections, gcruination tests and the breeding of corn for example, to increase its feeding value. At another point work has been concentrated on questions of animal hasbandry, the development of better stock and the study of feeding problems so that we may produce the maximum food with the minimum raw materials maximum food with the minimum raw materials kurther the problem of what an animal does with its food has been studied with the result that more is known concerning its economical feeding and the point at which further food means a substitution of water for the fat previously stored and then the critter eats his head off. Much of the stability of our dury industry is off Much of the stability of our drain indexer, a directly due to agricultural (ollies and experimental station work no small part of which has been the in vention of simple dependable testing devices. Then there is that research which led to an increase in the average number of marketable tobacco haves per plant equivalent to about 200 per cent increase in yield with the same amount of land and labor. Walnut trees that the same amount of land and labor. Walnut free that grow as rapidly as poplars and poplars which attain a height of 10 feet in 11 months are other examples of what can be done in agricultural research.

what can be done in agricultural research.

The dumping of cutton seed into the rivers of the South created such a nuisance that laws were exacted to stop the practice. On the basis of 1917 and 1918 prices the application of research to this waste problem added nearly 340 to the value of each of the 11,500,000. bales of cotton grown

Crickets ate the binder twine used in tieing the sheaves causing considerable loss in the wheat fields after the grain had been put in shock until chemistry showed how to make binder twine unattractive. It was not enough to make it poisonous for there were crickets left over to cut other twine It had to be made repellent

These will serve as examples of the influence of law and necessity in instigating research. To interest the average man in research that strikes out to find something is a much more difficult task. The war has been a great iducator in this direction and well qualified research en are in greater demand now than at any other time Ihree hundred and fifty-five American manufacturing rencerns maintain their own research laboratories and many more employ the facilities of commercial laboratories consultants and educational institutions. The total is but a fraction of the number which should take full advantage of what modern science offers and the aymau has yot really to appropriate research. Honce the proposal now to establish engineering research stations throughout the country one in each state or to appropriate money for each state to be expended in the support of research of importance to science and industry carned on in whichever educational institution might show steelf best suited to undertake the specific problem

show itself best suited to uncurrant the specific problem it is now proposed to grant \$15 000 to each state the irst year, \$20,000 the next, \$25 000 the third and \$30,000 the fourth and subsequent years. The details of dimanstration are not decaded, but the indications are hat an impartial committee in each state will be made osponsible, seeing to it that no money is spent without in adequate return in productive work and that no

favoritism is shown in the sesignment of problems. A central organisation in Washington will correlate the work advise and suggest problems of national importance but shall not be directive or administrative in its function. It may be found advisable to change the secretary of this central bedy annually appointing the secretary of the security of the security of the control bedy annually appointing the out the danger of stagnation. Such a post, properly paid would be attractive & many secentists qualified to perform the work since at world offer many advantages. The policy theory official stage that the control of the security standards.

This plau, known officially as the Smith-Howard Bill (S 3805 and H R 9080), is undergoing modification and improvement, many of our country s best minds being active on the questions involved The National Research Council, the American Chemical Society, the foremost educators and engineers sanction the principle and incan to see a workable plan prepared for the approval of Congress The competition between the educational matitutions in each state for this federal aid, extonal institutions in each state for this federal and, the granting of which, will in itself be recognized on the high quality of work being done there, constitutes one of the sure benefits Facilities will be provided with which those qualified may work under the but conditions as regarded equipment and assistance. A larger number of our young people will acquire the scenario method of attacks and become a equantic with materia-method with the benefited when they go out to it, the state of the provided with the provided with the state of the s the laboratory work In some instances research can be ected from present interesting but less practical lines to those substances of more urgent importance and equal

That federal aid to research can he given in a practical, efficient manner and be made profitable has been demonstrated to the second s strated by the agricultural experimental stations. We should do better, in view of our experience, with the new plan. The war has conclusively demonstrated the value of scientific research and all countries are organising to of scientific research and all countries are organising to pursue at diligently I he opportunity is offered for the people at large, our educational institutions and our industries to become really interested in research and to profit by its achievements in the various specific holds

Some Phases of Reconstruction

CHEMISTS generally realise that the post-war problems are more complex than those imposed by war
when questions of low costs and competition are not so
important. There has been much looking shead and
one of the first instances of concerted action was a
recent meeting of the Council of the American Chemical
Society. The question of what to do with our access acid production, our gas manufacturing plants and the muniton factores could not be considered a part of the program, the discussion being on subjects of general policy

The Germans have been called the brick layers, not the architects of scenees and among the tedious pieces of work performed has been the compilation of chemical data and statutates "Balletten had become an almost holy word in organic chemistry because in no other place could so much fundamental information concerning organic chemicals be found as in this excellent example of organic chemicals be found as in this excellent example of brick laying And yet Bellistein is not wholly satisfactory. The work of non-Germans is slighted in the statuties. It is 20 years old and incomplete Arrangements are now under way for English speaking chemists to combine on the truly genite task of pre-paring a compendrum of chemical literature in English to be compiled in each of the many sub-divisions of modern chemistry. Stags are also to be taken to make Souchy and notably "Abstracts" the vary best of their kind offering advantages which will insure the publication of our American work in them rather than in foreign journals as herstefores. The matter of tariff on importations of hemicals and

journals as heretofores.

The matter of tariff on importations of chemicals and seasothic apparatus has been of interest to many chemical neutrinos and a seasothic apparatus has been of interest to many chemical neutrinos and a seasothic properties of the seasothic properties of th in one university The

The need for a closer cooperation between universities and industries is apparent. If the industries are to continue to benefit by the work done in the schools and are to have men properly prepared for their service something must be done to make the teaching profession something must be done to make the teaching profession more attractive financially One of our greatest teob-nical schools, at the present moment, finds it almost the lack of money, and a professor can not pay his bils with sendment Industry must become more directly interested in education if we are to maintain our world-wide advantages. The somety appreciates the situation and a number of sub-committee are to be appointed to work with the main committee on this perplexing problem

problem. Chemists enjoy the unique position of being really interested in all industry either because they contribute some manufactured article or have some part in the development and maintenence work. They realise the mocessity of an active, sustained export trade and urgs any measure calculated to improve it. This is ample reason for urging the adoption of the metric system of weights and measures in the United States as rapidly as possible Many successful American exporters are using the metric system now, having found it a handicap to adhere to the English system in foreign commerce It is doubtful whether the metric system will come into It is consider a considerable property within a considerable property of years, due to alleged complications in land measurements although the civil engineer already uses tenths of the complex of the c familiar with it.

Closely allied with reconstruction is the work looking to guaranteed peace for the future. It seems important to guaranteed peace for the future. It seems important, therefore, to continue some of the research carried on so successfully by the Chemneal Warfare Service and to coordinate research in the War and Navy departments. This is also the time to record in full the details of what has been done on war problems and publish anything not of mintary importance for much of this research has both as essentifies and midurant indirects. The best talent cotta a scientific and industrial interest. In a bost taken in our country has been in cooperation during the emergency and it would be a distinct loss not to have all records clear before the first chemical military unit in hastory, and recognised as such, is allowed to disband

hatory, and recognized as such, is allowed to disband. The war served to emphasuse the desirability of more extensive American research in the field of drugs and medicines and to that end careful consideration is being given the suggestion that an Institute for Co-perature Research be formed in such an institute chemists, biologists and manufacturem would work together on the nearly innumerable problems which are

of practical as well as accentific importance. The American Chemical Society has only begin its study of reconstruction on the committee plan and its next meeting is expected to yield valuable results.

Scientific Patents

WHEREVER research is proceeding in sustained and in a sustained service of the communication may be expected. Because of the cortumntaneous under which estentiate serve in the Government's employ the practice of assuring patents to the people has been followed since early in the eighties. This plan has the fundamental waknows that unless zone protection can be secured no weakness that unsemments processor can be secured and one is going to see any process through its develop-ment stage and consequently very little has ever come of those inventions donated to the public is their infancy

Two siternative plans are now under consideration.
One of these provides for a non-exclusive free license One of these provided or the control of the pulsarion of the control of the contr

An Ruormons Log Raft for Overseas Transportation

WHILE log rafts are by no means new, insumuch as they are quite common in this and other countries, the huge raft recently constructed at Haparanda Swedon, and used to ship a large number of legs to Copenhagen, Denmark, as worthy of measine mention.

of passing mention

The great raft, which is shown in the
accompanying illustration as it appeared
anchored at a wharf in the harbor of
Copenhagen, measures 387 feet long, 55½
feet wids, 10 feet above the water line and 1614 feet below

The raft took six months to build and

se as much wood as four big steam contains as much wood as four big steamers. It is held together by an ingenious system of steel cables and wires, and is capable of carrying a large amount of material. The crew consists of seven men.

Magnetic Pulleys

MAGNETISM in some of its many IVI applications is so commonplace that t no longer creates particular interest Upon it the electric dynamo, the motor,

Upon it the escentic dynamo, the motor, the lifting magnet and many other familiar slectric appliances depend for their operation An out-of-the-ordinary application, however, and one that will be new to many readers is that presented by the magnetic separator pulley, as used in preatly mcreasing list of industries

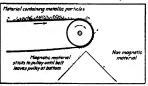

practly moreasing lat of industries. These devices are useful wherever it is desired to unove continuously the magnetic content from non-magnetic bulk material. For example, they are successfully employed in separating pick heads, coupling area and other metals from bulk good passing to a rusher which would be damaged by the entrance of under natural. They are used for a similar purpose at shoophate rock mines and quarries. In the production is sufficiently are available for removing ram iron and steel from the wood chips before these are leavesed to the suffite tanks. They are also found valuable in the manufacture of cement, the production of present and insection, the manufacture of cement, the production of present and insection, the manufacture of cement, the production of present and insection, the manufacture of cement, the production of typeum and hmestone, the making of terrs and doubly so in freeing grains, spices and pypean and amestone, the making of terra-cetta clays, and doubly so in freeing grains, spices and tobacco from att of iron and steel before granding. Even in such an impostic place as the city disposal plant they are put o work in picking out tin cans, horsehoes, nais, etc., rom the worthless material Likewise the high cost of netale has made the saving of metal turnings and the separation of iron and steel from brass well worth while

eparation of iron and steel from brass well worth white Another interesting application is found in the sugar ndustry, one m which it would seem that there would be to field for such equipment. The separator here is in-talled to remove from animal charcoal iron rust or iron ncide which is collected by it while passing through he ovens and being baked This baking process is

Huge raft made of logs held by steel cables, which made the trip from Haparanda, Sweden, to (openhagen, Denmark

necessary to eliminate from the charcoal the impurities necessary to eliminate from the charcoal the impurities which it has absorbed from the sugar. The magnetic material is especially prevalent after the retort has been repaired. Under ordinary conditions the magnetic pulley is energised only part of the time two weeks our of a most hor so, this being sufficient to keep the role.

How the magnetic pulley sorts out the sensitive from the non-sensitive

oxide out of the bone charcoal so that trouble with iron

oxide out of the bone charcoal so that trouble with iron coloning in the sugar is provided. A word or two as to the general scheme of operation of the magnetic pulley separator may not be out of place. It is magnetised by passing direct current windings in the interior of the pulley. He current sets up a magnetic flux which passes through the belt as it turns about

the pullcy thus attracting any iron or steel contained in the material which is carried on the belt. These pieces are then carried on the belt. These pieces are then held in outact by the pulley in til the belt leaves it on the under side. Here they are dropped, and collected in a lox which is kept well separated from the shower of the other material leaving the belt by means of a barrier is shown in our drawing means of a barrier vs-shown in our drawing. Direct curriet is required to incrigate the pullby although of course, the alternating variety will very likely be used to rotate the belt. Only a small amount of junce is necessary to keep the magnet working the average for the sizes in greatest use being but a few ampress standard pullevs can therefore be consected it any 110 or 220 wolf direct. current system although pulleys may be designed with coils suitable for operation on currents of 500 volts or even more

Data on Women's Work Wanted by Labor Department

THE Woman in Industry Service of the United States Department of Labor is collecting and distributing information on such topics as the extent of employment

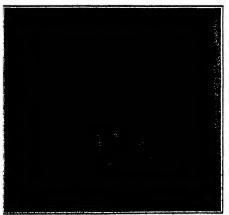

of women during the war, the wide variety of their employment the methods by which they have been successfully introduced into new occupations, and the safeguards with which it has been necessary to surround them in the interests of their health and efficiency

Plans are being made to establish a pictorial record of the work women are doing and the Woman in Inof the work women are doing and the Woman in Industry Service is asking for the endperation of the employers of the country in excepting these presents which women are working, particularly those in which women are substituting for men, mechanical adjustments installed to enable women to do work formerly impossible for them safety devices that have been found necessary to protect women workers and special

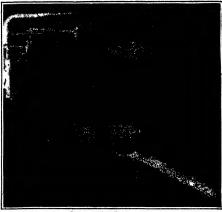

found necessary to protest women workers and special arrangements and caupment that have been installed for the comfort of the workers. Manufacturers would be rendering valuable assistance if they would forward to the Women in Industry bervice any pictures of this description that they have or are able to obtain. If any firm has recently improved the conditions under which its employees are working pictures taken before and after the improvements were turned to the contract of the conditions under the conditions and the conditions and the conditions are the conditions of the conditions are considered with the conditions are considered with the conditions are considered with the conditions are considered as a state of the conditions are considered as a state of the conditions are considered as a state of the conditions and the conditions are considered as a state of the conditions and the conditions are considered as a state of the conditions and the conditions are considered as a state of the conditions are considered

Wounded Canadian soldiers learning to operate farm tractors

Farm tractor built by a prominent Italian motor car company

Teaching Wounded Soldiers to Operate Tractors

THF problem of providing suitable occupation for wounded soldiers has occupied no little of the attention of manufacturers of farm tractors as well as others Canada which has had the wounded soldier problem to deal with for some time has opened a number of schools where the men are instructed in the handling of tractors and it has been found that even artificial limbs are not necessarily a serious disadvantage in this line of work Of course some of the men take to tractor driving more readily than others, but on the whole the idea has worked out very satisfactorily The matter is all the more important because good work with a tructor calls for a good operator, a good tructor with a poor operator is capable of turning out highly unsatisfactory work

There is an instruction base in Toronto, Canada where a considerable number of solders have been made familiar with tractor driving. All the men there have received wounds that have made it impossible for them to resume their former or upations, and the tractor idea has therefore a strong appeal to them The an artificial leg not withstanding which, he did excellent work

Protection for the Truck Driver

A the commercial vehicle grows in importance as a means of transportation the man who operates it quite naturally comes in for increased considernation. In winter weather he is likely to suffer a good deal without proper pro-tection. Such protection is afforded by a cab that is supplied as part of the regular equipment of a truck that recently has been placed on the market by a firm whose attention has inthirty been com-hined to passenger cars. It is customary to sell trucks 'in the chasses all ready for the body, but with no body on the frame. In this instance the usual cus-tom is followed, but the cab is added. The cab is of very substantial con-struction and instead of providing only custom is considered. It completely houses

partial enclosure, it completely houses the drivers seat. In front there are large glass windows which can be opened when the weather is mild and at the sides, in place of doors and windows there are heavy curtains that fit closely and snugly neavy curtains that fit closely and snugly and are readily adjusted either to open up the cab or to let the driver get in and out, in the case of the door sections

Very large flexible panels give a good view in all directions. The seat is more than usually well upholstered and, altogether, the driver of one of these trucks will find himself a good deal more comfortably situated than most of his fellows. Side lamps are mer t flush with the front The front panel at the same time forms the dashboard of the truck and serves to support the rear end of the hood

Engine Heats Its Fuel Three Times

THE very large percentage of kerosene found in the gasoline that is commonly supplied today has made it necessary for all manufacturers of gasohne engines to take incurry to supply considerable heat in order propriv to vaporize the heavy constitu-One manufacturer of

hight motor trucks takes the precaution of heating the fuel three times in order to ensure its being thoroughly a portion and to distribute the

thoroughly 1 portion and to distribute see heating uniformly throughout the vapor. The first heating is by means of the ordinary stove on the exhaust pipe, through which the air drawn through the carbureter is made to pass. Leaving the carbureter the air, together with the atomized gasoline which it has taken

wheels, makes a right angle with the
crankrose and gazerst housings, the whole

from the carbureter enters a passage cored between the cylinders this being kept hot, of course, as long as the engine runs I satly the gas impinges against a metal surface the other side of which is in direct contact with the hot exhaust gas -in fact the surface is one of the walls of the exhaust manifold. The result of this arrangement is a clean engine, maximum power and a low fuel consumption

Italian Manufacturer Prepared for After-War

Tractor Demand A LARGE Italian firm which manufacturers not only automobiles, but trucks, motor boats, surplanes and numerous other automotive products, has designed a three-plow tractor that is intended to supply the needs of the average farmer

Phantom view of a universal joint with large bearing helie

forming a big T. Bitch a construction gives absolute rigidity and all the strength that could possibly be required. The gearnet allows choice of three speeds and in fitted throughout with ball bearings and final drive to the rear axis is through a worm gearing. A peculiar-feature of the inactine is that the worm shall be such as the second of the speeds and shall be second through the bosing at the rear and carries the pulley for the belt used in diving stationary machinery. As the pulley thus comes between the rear wheels means are provided for very quickly and easily removing one wheel, on the side toward the machine to be jack is used for raising the tractor and holdingsit up when doing belt work. The source of power is a four-cylinder block-cart engine that is practically identical with the engine used by the same firm in one of it a 54-dow trucks and has a bone of 100 mm and a stopke of 180 mm. maximum speed of 2 7 miles an hour and a speed on low gear of 1.2 miles an hour and the rear and carries the pulley for

Big Steel Balis in Universal Joint

Big Steel Hellis in Universal Joint A UNIVERSAL Joint of teamsually inter-A cetting constructions used in a 15-5 con truck that is making, a good record for itself in service. It this joint there is a total absence of the brain fish theating surfaces and cytindrical Journals. In-stead there are singular hardward received hellis mounted on opposite such of a trumpion pin at the end of the propolar shelf. The steel housing of the joint is made with two oppositely disposed growers or races somurately formed for the tuffs to vort in; they are alongsized, theywere, as races accurately formed for the work in; they are elongated, by that the balls are allowed the lo that the balls are allowed in motion becessary to permit operate at an angle. The to turn on the truming plane are constantly skifting in

What Machinery Is Doing for the Walnut Industry

(Continued from page 51)

they are distributed across one end of a save which operates like an endless balt.

This save conveys the nuts beneath a chute which extends down from the over-head motor driven blower that operates the vacuum device. This arrangement the nuts which are below a certain waight leaving the heavier nuts of grades one a (we to pass to the end of the seve and glide down a long chute to the packing shed The third machine invented by mombers

of the association to convert the oull into a profitable by product is the shell separator.
This is used to handle the tailings of the After the nuts are cracked and the girls have extracted from the shells all of the meats they can find there are usually small bits of meat left in some of the shells, and women who are either careless or new at the work frequently overlook choice pieces of meats and sometimes whole halves while working over a pile of cracked nuts

noted that there was con siderable waste from that source, so be had a machine built to handle the tailings, and a manufacture to under the salings, and it has resulted in a saving of \$50 worth of broken meats per day anne it was put into pieration. This devore is built on the pian of a small threshing outfit, and yelds a product material which before the final situng, runs about 80 per cent the final sifting, runs about 80 per cent halves and broken pieces of nut mests and 20 per cent of shell particles

The walnut grower used to average about 3 cents per pound for his culis, and about 3 cente per pound for his sulls, and was unable to separate the shriveled meets from the sound ones, so the value of his better med or the sound ones. The sum of the sulls, and the sound nuts sell proportionately higher because they are of standardised quality. In 1915 the association cracked and sorted nuts by hand and marketed 431,000 pounds. Last year it sold all the means it could obtain, and these sold all the means it could obtain, and the sum of year it is marketing 1,500,000 pounds of culls alone by the by-product system.

Guns for the Fighting Front

(Continued from page \$8) five to plus 65 degrees, having a range of nine miles at the latter elevation. The total weight of this mount is 177,000 total weight of this mount is 11,000 pounds, the gun weighing 29,000 pounds, carriage 57,000 and car 90,000 The projectile weighs 700 pounds and the provider charge 65 pounds, which gives a mussle velocity of 1,500 feet per second I his mortar is not designed for long-range but for plunging fire at shorter ranges, where great penetration is desired. The shells, filled with high explosives, are very effective in destroying ammunition dumpe dugouts, cement shelters, quarries, etc When it is necessary to bring this mortal nearer the enemy, provision has been made to replace the standard six-wheel trucks by narrow gage trucks making the carriage very mobile and effective

Upon firing, the mortar moves to the open iring, the morear moves to the rear about thirty inches, the energy of the recoil being partly absorbed by the resistance which the fluid in the recoil cylinders on the bottom of the crade, offers to being forced past the pistons nortion of this energy, sufficient to return the gun to its original position, is abs by compressing the air in the recuperator by compressing the air in the recuperator cylinder on top of the oradic. The return of the mortar is eased by buffers in the front of the recoil cylinders. Approxi-matly 300 rounds have been fired from one of these 12-men mortar railway mounts with no impairment of any of the working parts

The guns above described are all adapted to transportation on railway tracks and in to framportation on railway tracks and in many thousand soldiers. It advances addition to those illustrated, mention against machine gun fire, and can pull gain toch railroad mount, model 1918, with its own amountion at which at a maximum elevation of 4.2 degrees fires a 200-pound propositie to a ranged 20,000 years This judgest and Tenfise to the propositie to a ranged 20,000 years The judgest proposities to ranged 20,000 years The judgest proposities to ranged 20,000 years The proposities to range 20,000 years The proposities to range 20,000 years The proposities to range 20,000 years 20,000 ye

mount permits of an all-around fire without changing the position of the mount on the tracks.

In addition to the above artillery, the Ordnance Department developed some mobile heavy artillery for transportation over the highways, and if need be, sore over the highways, and if need be, across the fields, quite independently of the highways. A very fine piece is the sight-inch howster mounted on a self-propelled carriage of the caterpillar type, so designed as to make the entire unit self-contained and adapted for quick mobility. The self-propelled carriage is designed along the same general lines as the articlery along the same general lines as the artillery tractors which played such a prominant part in the field operations of the Allied armies it is propolled by a four-cylinder, heavy-duty, tractor motor developing about 75 hors-power at 30 revolutions per minute. The design of this unit is such as to permit a few degrees traverse of the howiter to the right and left, as well as the full cloration of the poece. A small supply of ammunition can be carried on the platform of the gun mount, with a reserve carried on cargo-carrying "caterpillar tractors, sufficient to serve the howitser of battery of howitzers. This howitzer mount is capable of speeds ranging from about one to four and a half miles per hour, and is so designed as to require less than one minute to put it in hring position from road travel The total weight of the vehicle is approximately twenty-five tons, though on account of the large track area, the concentrated pressure per square inch is but slightly greater than that exerted by an ordinary horse Sufficient fuel and oil are carried to permit the vehicle to travel about ten hours under full load, without replacing the supply The new ordinance includes, also, an

eight-inch railway mount, with ammuni-tion car shell 200 pounds, range 20,000 yards, all-round fire

yards, all-round are
During a test the tractor gun climbed a
45-degrees ravine wall and developed a
speed of four miles per hour on level
ground, demolishing trees and shrubbery just as do the monster tanks

Five-ten Artillery Tractor

The five-ton artillery tractor, develo and built in large quantities by the Ord-nance Department, has put the horse out of business so far as pulling guas is con-cerned Deep mud, shell craters, sand or logs cannot detain artillery when pulled by this type of tractor. The Ordnance logs cannot cetain artisery week pulses by this type of tractor. The Ordnance Department has produced them in four sizes, namely 2½-, 5-, 10- and 20-ton capacity. Automobile engineers and auto-mobile factories with large production facilities made these tractors possible.

"Dreadnought" and "Baby" Tan

Tanks played the most decisive part in the later phases of the war, and the Ordnance Department, on a joint production schedule with England, brough tion senedule with England, brought out a 35-ton tank which, in its general appear-ance, is similar to the first tanks used by the British on the Somme This design, which is driven by an American 12cylinder Liberty motor, carries 12 men. Four machine guns and two ax-pounders Wireless outfit, by which communication is always had with headquarters, is a part

of its equipment.

"Machine Gun Cavalry" is the nam that should properly have been assigned to the American "Baby" or three-ton tanks, developed by the Engineering Division of the Ordnance Department Capable of a speed double that of a hors and with one man firing at a rate in excess and with one man nring at a race in excess of the firing of ten men with rifles, this type of tank saves the work and lives of many thousand soldiers. It advances against machine gun fire, and can pull guns as well as carry fighters

"Why is the price of meat so high?"

THF head f a Philadelphia family writes 15 ask us why the price of meat is 8 d ligi

The heavy de mand for meat ceused by lerge orders from the Allies and by high wages at home wages at home has helped to boost prices. The lower purchasing power of the dollarhas also caused.

the prices of all commodities to increase

But one impor-tant factor is the high cost of pro-ducing end merketing ment all along the line from ferm to retailer

The retailer for example must pay higher wages to clerks and more for delivery service—in fact everything entering into store operation has ad vanced tremendously

And the reteiler has to get a much higher price for meat because he has to pay the packers more for it.

Wages of parking house inhorers have increased over 100 per cent in the mail three wears

The packers in turn are in the same position as the retailers Labor transportation machinery, materials — all items in the packing business—have mounted rapidly But here agent the peckers have to gat higher prices for meat when they have to pay such high prices for live stock

During the past four years cattle prices to Swift & Company advanced 74 per cent whereas the price received for beef by Swift & Company has advanced only 61 per cent during the same period

The farmers have hed to get more for cettle because it costs more to raise

Corn for example has doubled dur-ing the past four years, farm labor is scarce and wages are high

But even with these higher produc-tion costs, the price of meat has gone up no more than the price of other foodstuffs—and this in face of the enormous quantities sent overseas to our Army and to the Allies.

If the packers were to eliminate their If the packers were to eliminate their profits entirely, there would be prac-tically no change in the price of meat. Swift & Company's profits average only a fraction of a cent per pound of meat.

Swift & Company, U.S.A.

Battleship Strength of the Pive Leading Naval Powers

the Kansas class and the five ships of the New Jersey' class. We have also eight ships of the 'Maine," "Alabama." and hearsage classes, mounting 12-inch

and 13 meh guns

It is considered that a battleship be It is considered that a battleship be-comes obsolite after 20 years of service and therefore the lows completed in 1897 and the 'Indians Massachu-sette and 'Oregon built in 1895 and 1896 must be reckoned in the obsolite class It-fore leaving the United States Navy-and passing on to the next three, we draw attention to the fact that because of the attention to the tact that because of the great size and power and resisting quality of our dreadnought ships they form a flest which under a single command is fully equal in strength and fighting power to a combination of the Japanese, French and

combination of the superior recombination of leaf superior recombination of leaf we wish, however very emphatically to draw attention to the fact that our navy, strong though it is in dreadnoughts, is very poorly balanced. We have no fast modern poorly balanced We have no fast modern scouts whatsoever, and these are absolutely commission in the strategy and tactics of modern naval warfare. We have six very modern naval warlers we have any very fine battle-cruisers authorised and partly under construction These should be pushed to completion, but we should immediately commence the construction of the 7,000 ton, 35-knot scouts of the should lay down a larger number of smalle and more handy type of equal speed, but of say 4 000 or 5,000 tons displacement Our officers who were with the British fleet k enthusiastically of a 35-knot scout of about 4 500 tons displacement mounting five 6-inch guns on the center line, and we hwe 6-nah guns on the center line, and we think it would be goed policy for our navy to lay down as early as possible at least a score of these in preference to the 10 larger vessels. We have authorized the con-struction of 10 dreadnoughs, four of them of the California type and the other ax to be of over 40 000 tons and carrying ten or twelve 16-inch guns. This program in common with whatever program Great Britain may have under consideration and primin may have under consideration and those of the other naval powers will come under consideration by the peace con-ference with a view to fair reduction on the basis of the respective requirements of the various countries concerned

During the war Japan has added aix ships of the dreadnought class to her fleet Four of these are battleships of over 30,000 tons displacement each mounting twelve 12 mch guns and steaming at 22 5 to 23 knots The other two are battle-crusers of 27 500 tons, mounting eight 14-inch guns and steaming at 27 5 knots She is also building a new battleship of 32,500 tons and 23.5 knot speed, designed to mount 10 15-inch guns upon which not much work has been done, construction

much work has been done, conseruction been stopped for the period of the war Of predreadnoughts Japan has 12 of widely differing military value Six of these are what might be called semi-dreadnoughts, masmuch as in addition dreadnoughts, massauch as in addition to their 12 gus, they carry a beavy intermediate battery of twelve 10-inch in the ease of the "Ak' and "fisharma," four 10-inch in the case of the "Kashima" and "Katori, and eight 8-inch on the "Kurama and 'Ibuk: The Japanese predreadnoughts are generally more modern than those of other nations, all of them having been built since 1900 and all having speeds of from 18 to 22 knots

The French News

The French ships completed during the war are three of the "Bretagne" class, 23,500 tons, mounting tan 13 4-anch guan. The French had hald down five ships of the "Normandie" class of 25,250 tons, mounting 12 18 4-moh guns in three 4-gun turrets, but they had done very little work upon the ships when the war opened, and

did practically nothing during the progres of the war Hence, the French nav includes at present only the seven dread nought battleships of "Bretagne" an

Remembering that a dreadnought ship includes nothing less than 12-inch guns in its main battery, it will be understood that the five French battleships of the that the five French battleships of the Mirabeau Ches which mount four 12- unch and 12-94-ind pura, example the considered available for the first scale of the considered available for the first Tailian "Vot Emanuele and the British Lord Nickon' classes these vessels must be resk coned in the predmadnought class which for the French navy inducts a total of 11 ships of obsolete vessels the French navy prosesses three

The Itelian News

Similarly to the French navy, the Italian navy had under construction when the war started some powerful dreadnoughts of which the keels had been laid but upon

which all work was stopped during the war These are the four ships of the Colombo class, 31 000 tots, 25-knot speed, mounting eight 15-inch guns. The five dreadnought battleships in commu-sion are from 21,000 to 22,700 tons displacement and 22 to 28 knots speed. One earries a battery of twelve 12-meh guns, the carries battery of threen 12-inon guns, the others a battery of threen 12-inon guns, mounted in three 5-gun and two 2-gun turrets It will be noted that neither the French nor the Italian navies have built any warships of the battle-crusser type.

Deterioration in Ultra-Violet Radia-1 tion of Mercury Lamps

THE reduction from the quarts mercury-rappr lamp are bung used extensively in accelerating photobomical sotions, as a bacteriside in sterilling water, as a therapeutic agent, in dy-rading tests, and in other connections. The violet and ultratherapseute agent, in dys-fading tests, and in other councitions. The violet and ultra-violet rays appear to have, as distinguished from the infra-red, a marked effect in many of these a tivuties. There has accordingly arisen among manufacturer of paper, dyes cirth, rubber goods, pants, ste, a distinct need for a ource of ultra-violent radiation of high intensity which does

not decrease with use

It is well known that the intensity of It is well known that the intensity of the radiation from quarts mercury-vapor lamps, especially as regards the ultra-violet component, decrease greatly with use. This decrease has been established qualitatively by several experiments, using physical, chemical and biological tests but no exact quantitative data have been available showing the rapidity and the extent of the loss in effectiveness, as a function of the time of operation of the

lamp
Some months ago the problem was presented to the Bureau of Standards Some months ago the problem was presented to the Burwan of Standards in attacking it it was first necessary, as is as often the case in the investigations of this Bursan, to device methods and instruments which would measure the deteroration quantitatively. The Bursan of Standards is quites in the habit of being Standards is quites in the habit of being the standards in the standard in th

to assuranced or whatever cles may be needed.

In the present case it was found possible to measure the ultra-violet radiation with a thermopule and a yellow glass. Several makes of quarts mercury-vapor lamps were examined, none was found to possess any great advantage over the others in point of initial scenage of the others are possessed as the point of initial scenage of the component was fruited to derive the component will be the component with the component with the contract of the methods used and the results obtained is given in Scientific Paper No 380 of the Sentence, just most of

The energy that met war problems unfailingly will meet the great problems of Peace.

Thousands of businesses face the emergency in the same spirit.

Pierce-Arrow trucks will serve these—help them to conquer difficulties of transportation greater than those we have conquered. We met successfully every condition of service in 148 lines of business. Call on us for help in expanding or redirecting transportation facilities.

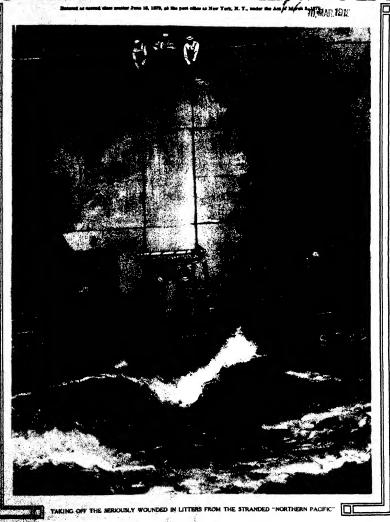

The greatest opportunity America ever had is before us. Will you take advantage of it?

What PITTSBURGH Thinks of Republic Trucks

In Pittsburgh, with its hills and heavy hauling, where power and stamina are absolutely essential half of all the motor trucks in use are Republics.

"We found Republic Trucks so satisfactory in spite of over-loading and stremous over time service that we have just purchased another Republic say Best Company, manufacturers of pipes valves

"Because of the demonstrated efficiency of the first Republic we purchased, we are now using a fleet including 1½, 2, 3½ and 5 ton, all Republics say W E. Osborn Co, large wholesale produce dealers.

"In spite of the severity of service in the oil and gas fields and over difficult country roads our Republic Trucks have been absolutely troubleproof," say People's Natural Gas Company

"Even the additional abuse of war-time driving has had no apparent effect on the Republic Trucks which we have had in operation for three years They continue to give the most satisfactory service," say Ziegier Lumber Company.

Other examples of Republic quality and depend able service could be given without limit Each of

the owners listed in this advertisement and hundreds of others have learned the efficiency and conomy of hauling with Republic Trucks That is why there are as many Republic Trucks in operation in Pittsburgh as there are of all other makes combined.

In every city, in town and country — wherever motor trucks are used — Republic Trucks will be found, in constantly increasing numbers, performing hauling tasks of the most exacting land.

Republic Trucks are designed and produced by specialists who know the severest conditions met by trucks in any kind of hauling anywhere and provide ample strength and power to meet them.

More than 1300 Republic Service Stations, distributed all over the United States, insure prompt reliable service to Republic Truck users everywhere

There s a Republic Truck to exactly fit the needs of your business. See the Republic dealer and let him help you select the model which will best meet your requirements.

Westinghouse AND CONTROLLERS

Raising the Skyline

Story on story the steel framework of the office building lifts its lattice against the

Beam after beam, girder after girder, alips into place. Swiftly the skeleton takes form and becomes a many windowed mass of steel, stone and concrete.

But the mere building is not enough. Ready to give elbow room to an army of 15,000 workers, it must include means to carry them swiftly and safely to their offices. Its twentieth floor must be as easily available as its third. Reaching the street must be a matter of but moments, and little trouble for workers on any floor.

Yet few realize how necessary is the machinery of transportation that fills and

empties the many floors of the modern office building.

Without quick, sure, perfectly controlled elevators, no sane architect would design a building of forty stories

Without electricity, which alone meets all the power, speed and control requirements of the elevator, there would be no Woolworth Building, no Equitable Building, no Metropolitan Life.

Without electricity, New York's skyline would be low and level, and the whole thirteen miles of Manhattan Island's length would be needed to house its office workers.

Truly, the electric motor has been as vital as steel in raising the skyline to where it stands today.

Here, as in every other place of business, commerce and manufacture, for which dependable, flexible power is required, Westinghouse has taken an important part. Westinghouse Elevator Motors and Controllers serve today in many of America's best known buildings.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO. East Pittsburgh, Pa.

Brarting the symbles of greats buildings on their homeword trip—currying them up floor sites floor in the morning, is an enormous task even for an electric slewetor. Westinghouse Motors and Controller want to the service unfailingly every

Submarine Range-Finding by Means of Reflected Sound Waves

AT best, submarine visibility is limited to a few handred feet Even with the most powerful searchlights and the most improved sighting means, deply submerged objects can be detected only within a 500-foot range, which, obvously is too circumsembed for practical purposes. And it is that very fact that has brought about the submersible fighting craft, which can steal up to its intended vottim, descharge the torpedoes, and get away without showing much more than its this persoops for a

brief mounant

When the United State entered the war, and when the U-host ompasjar was practically at its height several American inventors act to work on the submarize detector problem. Among them was Mr. Zilas Rice, an electrosis engineer of New York otly, who worked out a submarine sound-detecting apparatus of the type shown is the se-

submarine accordance of the type shown in side accompanying crawings.

Mr Rass will be resalted by the constant reader as the mreator of the gestern of serial. "ears" for mariners, which permits the sources positioning of scaberg, andmarks, where also are on undergother thickness (ope, and whick was described in these columns some

Port and Harbor Facilities

NI of the most important papers presented at the War Emergency and Reconstruction Congress at Atlantic City in December last was one bearing on the very serious question of the Port and Harber Facilities of the United States | Ihis matter is very intimately related to the question of the greater American increhant marine which is now in course of construction

The strange national complacency with regard to the absence of an American merchant marine disappeared with the withdrawal of hundreds of thousands of tons of neutral and German shipping from our commerce and with the massivat demand for 1 stroms resulting from the enormous purchases of munitions and war supplies by Great Britain France Russia and Italy Manufacturers were hurrying shipments to the Atlantic ports, regardless of the dates of sailings of vessels and the lumited storage facilities at those ports Wharves docks, freight yards, warehouses, etc became choked with freight and for miles behind the subboard sidings and tracks were congested with loaded freight cars

The solution of the problem was sought in the two directions of building a large merchant fleet and of increasing the efficiency of the port and harbor facilities Investigations by the Shipping Board showed that the dry docks were utterly inadequate to meet the needs of the ships in use, that the methods and appliances for loading and unloading cargo in the majority of the ports were inefficient, that the marine terminals were insdequate and that there was no co rdination of towage and lighterage facilities As the result of its investi-gation, the Shipping Board created on May 23d, 1918 the Port and Harbor Facilities Commission

Careful study of the various elements entering into the export and import trade of this country has convinced the Port and Harbor Facilities Commission that one of the most important factors in the upbuilding of our maritime commurce is the adoption of a soming system under which exports and imports will flow through those ports which are within economic trans portation distan : of the points of origin and destination Knowing the point of origin of a commodity the deterministion of the port through which it should be exported does not by any means depend solely upon proximity and railroad facilities. Other factors enter into the question such as the per entage that is exported of the total of a commodity that is mined manufactured, etc at a given point Statisti s tell us the total amount of a commodity exported the 1gh our various norts, but we have no statistics showing the proportion of the total exports distributed by the several points of origin Thus we know that in 1914 Illinois produced three times the amount of agricultural in plenents that was produced in any other state but it does not follow that the same proportion obtains it regard to exports That is one of the subjects which the Commission now has under investigation A like con litt in obtains in respect to the destination of imputs Statistics tell us the total amount of each commodity received annually at each of our ports, but we have no data as to the destination of these commodities I his is a matter of supreme importance, for the success of a port depends on its ability

to maintain an economic balance between its exports and its imports. Thus, a port may be the nearest point at which a vessel can unload, but if it cannot provide a return cargo, the vessel will make another port at which such cargo can be obtained. The Commission is now engaged in determining what proportion of our export trade originates at each of the important centers of production, and to what points our imports are distributed With these statustics tabulated, the Commission will be able to establish an economic soming system

The congestion at the North Atlantic ports was due mainly to the fact that 75 per cent of our war industries are located east of the Alleghany Mountains and north of the Potomac and also to the fact that the Allies being our largest purchasers, there was an unprecedented movement of freight to the Atlantic sonnorts

The use of pier transit sheds as storage warehouses has en a serious handicap The Commission recommends the construction of adequate warehouse storage facilities, inshore and adjacent to the transit sheds as the most effective way of mereasing the efficiency of the marine terminals

It must be understood that the Shipping Board does not possess any authority to finance the improvements necessary in the various harbors of the country and it believes that the best guarantee of the success of a port is the investment in its improvements by those who be benefited by the resulting increase of its business To this end the Commission has urved the municipal officers of all seaport cities to so perate in the appointment of Port Commusions, whose functions will consist in stimulating interest in maritime commerce in their everal communities and in the territory tributary to their respective ports

When the ships now in course of construction are completed, there will be approximately 17 300,000 dead weight tons of shipping under the American flag That tonnage will call for a very large equipment of dry do and marine railways-in immense undertaking in itself Furthermore, the Commission is recommending the extensive introduction of modern, improved appliances for the loading and unloading of freight

We can well believe that each step taken by the Port and Harbor Facilities Commission in the course of its investigation has served to impress it with the importance and magnitude of the task with which it has I betrusted

Compared with our wealth and our vast and evergrowing commerce, our port and harbor facilities are woefully inadequate, and in our great effort to build, in a few years time, a merchant marine which normally would call for several decades of growth we must not forget that our port facilities are also far below requirements and that they must be enlarged improved, and thoroughly modernized, contemporaneously with the construction of our new merchant marine

Our Achievements in Aviation

TITH the raising of the ban of censorship, the story of America's effort in the air can at last be told in its entirety It is a remarkable story, for it tells how the United States, in the brief space of a year and a half of war, established a gigantic a nautical industry, built up a huge fleet of airships of all kinds, trained an army of airmen, and developed a standardized airplane engine as well as several all-American types of airplant

named for Major-General George O Squier, Chief Signal Officer of the Army, to give us real facts and figures concerning our aerial activities. This he did during a recent address before the American Institute of Electrical Engineers in New York City The facts and figures given below are his

At the outbreak of the war we had a negligible size fleet, comprising a handful of training planes and about as many trained fiters. There was no real aeronautical industry Our aeronautical engineers and dougners were so few as to be negligible But once we entered the war, our Government immediately realised the importance of aviation The \$10,800,000 appropriation granted in the act of May 12th, 1917, the \$31,848,600 and finally the \$840,000,000 left no doubt that we w

As to what has been done, we first learn that 8,806 fliers have Been trained in this country since the war began. Monthly graduations at the figure schemin have constantly increased. Figures give our insisting faidfilled to be less than those of any other country. On the students have flown more than 880,000 heave, which is the equivalent of 66,000,000 miles. The monthly average in the United States has been only one faightly for each 5,300. hours flown

More than 16,000 Liberty engines were produced in the calendar year 1918. To November 11th, 1918, soore than 14,000 Liberty engines were produced, equivalent to 5,700,000 brake horse-power

On November 11th, 1918, there had been developed, tested and adopted by the Army four airplanes, on which production would have started this year. They were the Lepere, the De Haviland 9-A, the Martin twin engined bomber, and the Loening two-seater fighter The first three were equipped with the Liberty segme, while the last carried the Hispano-Suiss engine also being turned out in quantities

To turn out the vast number of machines shipped overseas, an industrial army of about 350 firms an corporations, employing more than 200,000 men and women, had to be mobilised. A cotton fabric had to be developed to take the place of the linen formerly used for airplane wings. Huge lumber camps had to be organised in the Northwest, in order to obtain the spruce and other lumber required

Meanwhile the Navy erected the large Naval Aircraft Factory for building its own planes It developed a huge flying boat, equipped with two Liberty engines, for anti-submarine, convoying, and coast-patrol work It developed a still larger flying boat, equipped with three engines, which recently carried 51 passengers

Many achievements were scored in the research field Our chemists worked out a commercially practicable method of obtaining non-inflammable belium gas for balloons and airships, thus placing these lighter-than-air

craft on a more equal footing with the airplane type
All in all—and the foregoing is only the barret outline of what has been done—our record in the air has been one of the greatest supprises of the war.

Electric Waves from Ocean Tides

BSERVATIONS which indicate that there is a subterranean electric wave analogous to the ocean tide and derived therefrom have been made at the St Louis observatory on the Island of Jersey, and recently reported before the French Academy The iron pipes which deliver gas and water, respectively, to the observatory, on being tested by a sensitive galvanometer showed istence in the ground of an electro-motive force of 0 1 volt, whose variations were registered photographically through a period of ten months. In the opinion of the observer, M. Mare Dechevrens, the current is evidently ted by action of the moon, through the oceanic tides

The voltage exhibite a maximum value twice a day and a minimum value twice a day, the two ceciliations are almost equal, like those of the level of the sea.

The entire variation is accomplished in about twenty-five hours of solar time, the maxima and the minims for any given day therefore comurred 50 minutes minims for any given any secretors quantum on hautrees later than upon the day before. This is precisely like the daily retardation in the passage of the moon to the meridian and like the daily retardation of the tides.

If it is really the movement of the waters which is the origin of the electric current observed we would not expect to find the maximum voltage concurring with high The manmum electro-motive force may be seen nected with low tide, preceding it by two house,

The maximum amount of attraction upon the water by the sun and the moon acting together takes place at the time of the equinectial new modes. At Jersey, the highest tide which results from this action in concert is not produced until after the lapse of an interval of 40 hours and 30 mountes on the average. The greatest variation in the electro-motive force at the same period is registered as a minimum of voltage about 38 huggs and 30 minutes after the rise of the new moon, or two house

be discussed and the state of the year.

During the development of the state at James the sea vises during a period of 5 hours and 40 minutes to Rel. In the size of the state the decime current the intervals of time which most closely second with those of the title area 5 hours and 28 planutes for the diminution of the voltage and 7 hours and 15 minutes for its increase.

Electricity

A Simple Cuttle Clement as bein in use for ricustine posit, in Clement and other European countries. It possible subjectly of a flat metallic tube in which a series of notobes are made with a special tool after the two conds of the cubic too joined are properly inserted The contact is said to be perfect, and the grip is such that the cubic breaths before the connector gives well.

Wireless and Morale.—Sunce the armistice brought homilities to an unit has been larged that the morals of the population of Life was maintained by never given from a French wireless station hidden from the Germans according to Wireless Age Good news syraed quickly through underground channels. The people knew that 18,000 Amerones seldiers were surviving duly. Airplance also dropped many leadets, whole were eagerly taken despite German efforts to prevent their distribution.

Efficiency of the Moore Light — A contribution by M Wolfke to the Bulletin of the Association Susses des Electricians refers to some tests carried out on a Moore tube installation using earbon doxide gas Figures for the consumption varying from 47 to 60 watts per befrare-candle are given and it is shown that the former was appearedly a manipum when the matallation consumed about 2 000 watts — in the case of tubes filled with stricgen the efficiency as much better about 1 to 2 watts per hefuer being recorded, while the Neon tube operates at less than 1 watt per hefuer. It is known also that the efficiency of the CO-Moore tube can be matern ally improved by mirchodings a choker in the primary climits with a view to producing a modification in the form of the ways.

Betteich Radie Telegraph Schemes —It is reported that various schemes are under consideration for the development of radio-telegraphy throughout the British Empire particularly in the Far East the Penofic, and the West Indies It as proposed to establish stations at Sigaspore Colombo and Hong Kong that Ill be able to esemintiests with the systems about to be established to seemintiests with the systems about to be established in China and with those stream of winting in Japan. The stations to be established in the Southern and Western Pendife will some into line with the Australian and New Eschand systems. Some of the islands of the British West Indies are shready connected by radio telegraphy but it is proposed to extend and improve the system so only the state of the state

Riveties Ships—The Committee of Lloyd a have recently earlied out a series of experiments to determine as far as can be done by means of tests and analyzes the general trustworthiness of structural connections effected by electric welding and their capacity to stand the strains to which they would be subjected in practice. The Committee had before them the report from the society and to sessife them in their dollberations a demonstration was given at the society's offices. After careful consideration, the Technical Committee fordied to recommend to the General Committee fordied to recommend to the General Committee for approval certain recommendations put forward by the Chief Ship Surveyor as all the conditions on which, as a tentative measure, welding night be adopted instead of riveting in the construction of vessels intended for classification in Lloyd's Regular Book.

Bisenceptacing to Balence Shalls—According to Uses, in most muscine work there will be found in spite of the case of the mechanical processes, a certain number of habit that are held by balanced I? is destrable, if possible, to save such shells, and variests methods of recovery the balance have been tend for example sachs have been conjuged to reduce to transplatines and layedwar excitan dangers in mentionation. A bester mostach, but this gives rise to impossible the same layedwar excitan dangers in mentionation. A bester mostach, which has been more recently engaged to the disposit a method account of the same point by a simple observable model of the same point by a simple observable model of the same point by a simple observable model of the same point by a simple observable model of the same point by a simple observable model of the same point by a simple observable model of the same point by a simple observable model of the same point by a simple observable model of the same point by the same point of the same point o

Science

Expansion of Insulating Maxerials—During the part year the Bureau of Standards has tested and hear treated a number of synthesic insulating materials such as baselite condensite formus etc. in order to sottam information required in connection with the Bureaus spark-plug investigations. The tests show that without exception the sit since above mentioned are usualitable for use in delectar as paratus which may be subjected to temperatures above 60 deg C. The thermal expansion soon vanishes and continued treatment shows marked contraction and loss of weight of the specime. The Bureau will publish a paper on this subject

Branch Hydrographic Offices in War Time—
During the war the various branch Hydrographic Offices
of the Navy performed a large amount of special work in
addition to their routine duties of collecting and disseminating martition information. Five of them were engaged in recruiting and circ lling four gave instruction
in navigation to Reserves as Anvaid Mittat others cooperated in navial intelligen or wisk purchase of sex
tants compass inspection cable censorship and the
Eyes for the Navy movement whish resulted in their
bosaides numerous other instruments as loans to the
Navy.

New United States Life Tables -In the year 1916 the U S Census Bureau p blished a collection of life based on the census of 1910 and the mortality in the three years 1909 1910 and 1911 for the six New England states New York New Jersey Indiana Michigan and the District of Columbia These tables were similar to those prepared by his insurance companies except that they related t tl store population of the area covered instead of bong limited to risks selected through medical examination (r otherwise. The Bureau now announces that it has ready for publication a new series of similar tables exhibiting mortality conditions in 1890 and 1901 and duri g the decade 1901 to 1910 inclusive In connection with certain tables there will be given commutation columns and data as to annuities and single and annual premiums at various rates of

New Quarters for the Hydrographic Office -The hydrographer of the Navy in his last annual report calls attention to the urgent need f ni w and permanent office accommodations for the Hydrographic Office Like so many other branches of the (overnment the Hydrographic Office is now domicaled in rented rooms which are both crowded and ill-adapted to the work carried on In this connection Admiral Schroeder revives the project of consolidating the Hydrographic Office with the Naval Observatory : e a return to the arrangement that existed prior to 1866 and notally in the days when the achievements of M F Maury shed lustre on these two establishments of the Government The lease of the present quarters expires in 1923 which would be a favorable time for the proposed an algamation The hydrographer s plan is to erect a building for his office in the Naval Observatory grounds where ample space is available

The National Physical Laboratory the leading establishment in Great Britain devoted to scientific research has grown so rapidly under stress of war require ments that it now has a staff of 532 as compared with 26 in 1902 The last annual report although as in previous years since 1914 chiefly notable for the tlings that, for military reasons it omits to mention is an impressive record of strenuous and valuable work buildings are in course of construction to provide facilities for manufacturing a certain class of gages and for testing glass vessels for chemical work—both undertak-ings being on behalf of the Ministry of Munitions The number of munition gages tested at the laboratory has amounted to nearly 16,000 a week Additional large au channels have been required to meet the demands of the Air Ministry More than 8 000 chains thermometers have been tested per wask. Three new clinical test baths have been provided, each having a capacity of 600 thermometers a day Under the head of option buildes concevers a cay concever the need of option beadest couldn't steeling on a large scale important work has been done in testing the refractive properties of option glass and in simplifying the calculation and design of optical

Aeronautics

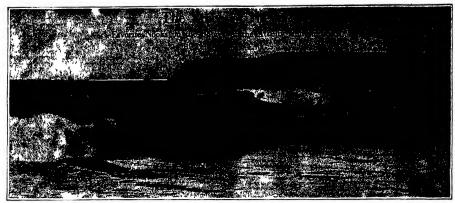

Alrysams for the Sportaman—Now that the unitary avastor is returning to penceful jursuits there are many who believe that he will not give up flying Indeed there are a veral aircraft instructors who it aircraft of the strength of the property of the section of the offenings is it if rm if a smill big it designed for the niam who ril is his ranch in tid the ini wholoves the air to quote the manufacturer so inno inemet. It is known as the Dispatch Model and sells for \$2.000. The factor of saf ty is said to be high while the cost of upkeep is low.

Weather Forecast for Filters—The first aerals weather forecast to be assued in the United States was made public recently by the Weather Bureau in copperation with the serial mail service of the Post Office Department. It was as follows—New York to Cleve Land cloudy 8 P M Snow near Lake Erre Win is moderate northwest to north northwest east of the moderate northwest to north northwest east of the Mileghanes up to 6 500 feet and moderate south winds west of Alleghanes shifting to west southwest at all out 1500 feet. Porecast snow today Monday with in creasing northeast to north winds up to about 0 000 feet in the property of the company of the New York to Cherago mail service inauguration of the New York to Cherago mail service between those and intermediate cities it is understood that the forecast is to be extended to all the territory covered by the engaged nostines.

German Aircraft for Peace—From such reports as have reached us snoe the agming of the armster it appears that the German are bent on making the most of their huge accommutate a testing the most immediately after the armster was sugned the Staken plant located near armster was sugned the Staken plant located near into commercial mechanes. The Germans have made it into commercial mechanes the Fig. 1 of the fighting planes on handing the sum of the staken plant located near shown to the entire world that they intend linking up all the European capitals with Breim Already dozens of planes built entirely of aluminum have been trans formed for an oxionsive arrail postal system it is said that a huge machine is bring built at the Staken works for a transatiantic sight. The mechanic has a wing-spread of 198 feet and its multiple-engine power plant developes 3000 horse-power.

The Race to the North Pole -It seems that Captain Bartlett is not going to have things entirely his own way in his airplane expedition to the North Pole for at the present moment the British are also planning for a similar undertaking So the similane expedition may take on the complixion of a sporteman like air race with the Americans represented by Captain Bartlett and the British by Salisbury Jones of the British Northern Exploration Company Cantain Bartlett contemplates going to the Far North by way of North Greenland while Mr Jones is going by way of Spitsbergen which when reduced to mathematics means that the Americans will have some 2 000 miles to go while our British cousins will have only 900 miles of journey Mr. Jones believes that his expedition can make the flight in about nine hours

An American Passenger Carrying Record -Recently the NC-1 a U S Naval scaplane broke the world a record for passenger earrying by flying with 50 passengers at the naval air station at Rockaway N Y No special modifications of the plane were made for the flight which was intended to demonstrate the machine s lifting power The NC-1 is the first American tri-motored seaplane She is of the flying boat type with wings having a spread of 126 feet With th low-compression Liberty motors of 385 horse-power each the huge scaplane makes a speed of about 80 miles an With the 50 passengers the scaplane developed 72 miles an hour It is not believed that this record will long endure for there are many giant airplanes and seaplanes now ready for flight or almost ready which will soon challenge the present record The day of the large beavier-than-air machine has arrived and the petition seems to have swung from the lighter and faster schines to the large weight-carrying machines After all the latter are the ones that have a true commercial value which accounts for this change in effort Caproni the Italian exponent of huge machines is reported to have a triplane of 2,100 horse-power which should carry about 70 passengers, while another rapidly nearing completion should carry 100 or more passengers

The surf at the entrance to San Diago barbor

ONF of the most beautiful sections of our Atlantic coast is that of the north short of Massachusetts Extending from Nahant to Cape Ann and beyond to the fast nating sand dunes of Ipswith may be found a sur prising variety of delicately curving beaches rocky pine-clad points and brown wave-swept reefs and ledges over which the sea mur

reas and lodges over which the sea mur-murs softly in summer and storms wildly in the great gales of a northern writer. At Swampsott-ty the Sea one finds a charmingly varied coast line with hold forbidding chiffs and wooded hills. The view from the tower of Phillips School is of surprising extent and beauty Beyond the slender finger of Lincoln House Point the sleader finger of Lincoln House Point is anchored a remmant of the fleet of schooners that in former days sailed to the Grand Banks returning laden to the water e edge with cod haddiok and hali but I a the distance Egg Rock rises boldly from the ocean irear the long pennants of Nahant while on the horize a the South Shoen of the Lower Lincoln Lin Shore often looms in fanciful mirage White sails gleaming and constwire steam white sails gleaning and consume steam ers training long ribbons of smoke pass ii and out of Boston harbor. Across the water are the spires of I ynn and beyond are the towers and domes of Boston Landward the eye rosms over a vast forested area of rolling hills while the north affords a glimpse of Salem and the sea

On the beach among the clam shells and lobster pots On the beach among the sams shells and sobset pois on may find the masters of many a long-departed vessel ready to spin their yarns of storm and shipwised. Dor-ies laden with the morning a saith of fish or with men-returning from the note are constantly arriving and on the bay the sails of pleasure craft are fitting back and forth before the breese. The summer visitors stroll along the beaches in the sumshine or loter in the meonlight when the sea is calin, but none are here when the storms of winter sweep in with sudden fury from the

Flood Gates That Take Care of Themselves

AT Nashua Iowa there is a very interest ing dam which impounds the waters

A in gam which impounds the waters
of clear River for a hydroelectric plant
for dam is a concrete structure 17 feet high. The
most interesting feature as the means of keeping
the water at a constant level back of the dam
ceder River in time of flood rises rapidly and has
a very swift current and so flood gates were insaid in the dam which would open auto-

matically in proportion to the increased pressure of the water and prevent an excessive rise of water back of the dam. The Switzerland where such structures are not uncommon It consists of a pair of gates, each hinged at the bottom and connected at the top to a pair of walking beams

counterweights of concrete
I ach gate is 46 feet long and is arranged to hold back a constant head of 7 feet When the water rises the gate swings down and the counterweight is lifted To compensate for the increase in leverage of the outwardly swinging gate the fulcrum of the walking beams is correspond-ingly advanced. This is effected by the use of toothed wheels on the beams, engaging racks mounted on the concrete buttresses of the dam so that a rolling fulerum is provided A certain amount of adjustment is furnished in the means of attaching the counterweight to the beam Cam links are provided as shown in the accompanying drawing with a number of openings at various distances from the center in which the connecting pins may be located

The gates are of steel covered with wood slanking, and leather is used to prevent the water from leaking through the hingc joint and also around the ends between the planking and the buttress walls

Fig. 3. Effect of error in course

Curved or "S" Courses

A Protection Against Torpedo and Gunfire

EARIY in the war ships were accustomed to steer a straight course and formed an easy mark for the submarine but in 1915 all the allied nations adopted a method of steering on zigzag courses and this proved to be probably the most effective of all the many devices to clude the torpedo During the course of the war Mr Lindell T Bates Secretary of the Submarine De-fense Association devised and patented a method for enabling ships to steer on continuous curved courses in which there would be no straight course whatsoever This method is an improvement upon the rigrag course and is a logical development of its principles. The Submarne Defense Association rountly with on record with the statement that This more than any other invention of the war time will ad submarine defense and profoundly affect coast defense armanent and naval tactics

In order to reach a torpedo firing position the sub-marins must submerge at a considerable distance and proceed under water until she comes within firing distance. This firing distance should be not over a thousand yards. Indied during the war because of the difficulty of hitting the Cerman U boats are said to have received on attend the certain to loads are said to have received instructions if possible to get within 400 yards before letting go At a range within 1000 yards, if the torpedo is fired before the vessel puts her helm over, there is but little chance for her to avoid being litt.

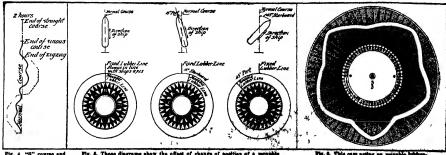

For a torpedo firing position within a 1 000-yard range to be reached and a torpedo to be aimed with accuracy, to be reasoned and torpied to be aimed with accuracy, the submarino captain must learn three things (1) the course on which the vessel is steaming (2) her speed, (3) and the range or the distance between submarine and ship With this data the problem becomes simply and ship. With this data the problem becomes simply one of the solution of triangles in whith the bearings and range of the ship and U-boat speed of the ship and the torpedo and the angle of torpedo fire are utilized. The object of this calculation is to fire the torpedo at a point ahead of the ship so that it will cross the ship's course at the time when the ship reaches that point

Effect of Maccalculation of the Ship's Course, 2 and Derivace

The effect upon the success of a submarine's maneuver for position of an error in estimating the course, speed or range of the vesses, may be very super-may be seen from Fig 3, an error in course—estimate of from 10 to 20 degrees, in a direction which carries the vessel toward the U-boat while the latter submerged, is to the course of the reaction—may result eed or range of the vessel, may be very important vessel toward the U-foot white the letter submerged, as approaching the 1000-yard fring position—may result in the submarine, on emerging to make corrections finding itself so near the ship, that it will have to remain under water to escape guafire and the depth bozzh. It the submarine makes as error in course-estimate which carries to vessel away from the submarine, the latter on emerging will be so far from the ship as to be outside of torpedo range. If the submarine overestimates, the speed of the vessel it can upon coming up for observation await of the vessel 1 can upon coming up for observation await the ships a rarria or maneuver closer but if the U-boat underestimates the ship's speed, she will on emerging find that the ship has passed the descred firing position. This will be clear from Fig. 1. If the range or distance to the submarine has been underestimated, the opportunity for torpedo attack may be lost. A serious overseitments of the durfance may bring the submarine too close and expose her to being rammed and sunk by fire and death boards.

and depth bombs Now the estimation of the course upon which a skip is steaming and its speed are necessarily difficult to make with certainty. A series of observations is made at successive intervals, and it is the object of the various forms of camouflage tending to produce optical Illianous as to the fore and aff axis of the skip, to running under water for a grava time and coming up for a final peri-water for against the same coming up for a final peri-Now the estimation of the course upon which a ship copic slight or series of authe before launching the torpedo within a distance of a thousand yards, is despedo within a distance of a thousand yards, is despend on the control of the con

meshanism for steering curved courses, which has been tried out with very anountaging results. The types of courses adopted are designed to permat to the greatest speed and distance of travel for the ship with the largest immunity from torpedo or gunfire his, and it consists of a succession of simple or compound graduated spiral area, so arranged that the curves mal-isto one another Sude spirals are selected as are of sufficient curvature to confuse observation by the U-book, or by the gunnery officer of a warning rofer, and yet will be such as will not too much retard a vessel or cause hat to less teen much difference a connected with yet will be such as will not too much retard a vesses or cause her to lose too much distance as compared with a straight course. The embarrasament of a submarus captain in attempting to determine the source, speed and range of a vessel that is steaming on a curre will be widnot. The problem is difficult snough when the vessel is steaming on a straight course, and from a distant

"8" course and

Fig. 5. These diagrams show the effect of change of position of a movable

omerine the angle of departure of a curved course is assistally impossible of determination guarda a long double of experiments in curved-course saming, it was found that the retardation on the red course with the saw angle of helm used at all see at less than the whole retardation for a vessel making it, a finance course in which the shapes of ming on a signag course in which the changes of we are through a large arc

matic Course Indi

The automatic course indicator was prepared with the following ends in

- 2. To impose upon the heli in such navigation no duty in addition to the one to which time and experi case have accustomed him-namely that of watching the compass and maintaining in alimement on it the normal compans-mark with a lubber
- To supply the navigation officer 3 To supply the navigation union and helimenta at all times with definite information, in intervals of time and units of distance, relative to the position of the vessel on the signag, "8" course, or curve, and relative to the normal straight course.
- 4. To provide an instrument suited to any vessel, whatever her speed, and whatever her variations in speed, her size and other characteristics, and

but were positioned on the fixed comp run, may fifteen degrees to the right or starboard of the longitudinal axis of the ship then the vessel would not be steering north, but 15 degrees to the west of north

Conversely if the lubber line were moved to the left or port and the vessel were turned accordingly the ship would be found to be heading east of that compass direction, the same number of degrees as the line was moved to the left of the longitudinal axis line of the shin

The principle of the course in licator is as follows lubber line is marked on a 111, which is retatable A lobb about the compass car! If the in is moved to the

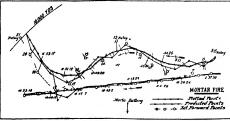

Fig 7 This shows the difficulty of hitting a ship that is sailing on a curved or S course

It slips above the course as resimmated by effectivent, it is land fort and the point of fall of shells (see detected line and circles) freed at sife skip. It shows the difficulty of predicting the point at which is ship will be when the shell stitute. This difficulty is due mainty to she first that the gunner set makes of the fatture printingers this shelp are based upon the creations assumption that she is sailing and the fatture of the fatture printings are shell of the course of the fatture printings are shell of the shelp are based upon the creations assumption that she is sailing and the fatture printings are shell of the shell

her size and other characteristics, and designate to any type of compass, magnetic or gyrescopic, i. left or right of the axis of the ship then by cassing the characteristics are now averaged by using the hoins or that "selected compass mark to follow it the ship will go to what is incover as a "hibber-line" on the fixed compass are characteristics are as the second of the compass and two particles, which line is set in line with the vessel a longitudinal looks at a given course mark in the compass and keeps are considered to go seat the beliancement turns the ship until the compass are considered to go seat the beliancement turns the ship until the compass are considered to go seat the beliancement turns the ship until the compass are compassed in the compass and compassed in the compassion of the compassion o means of a grooved cam as shown in our illustration Fig 6 The cam which is contained within the bin Fig 5 The cam which is contained within the our nacle is rotated by means if a small electric motor it is evident that by outting the cam to correspond with the curve or 8" course which the ship is to

follow the ship will automatically because of the movements transmitted to the lubber line from the cam steer the learn I course. A ship will carry several A ship will carry several of these cams for as many different courses as may l desired

The value of the curve i or true as a protection against gunfire whether from an entry ship or a shore on placement will be exist at nec placement will be exifint at nee and Mr Butes has jubi hed a le scription f the emplyment of the curse in heat r during a special maneurer of a ship and b free certain coast fertification with the

permission f the military authorities The description of this interesting Murtars are the main coast de

fense reliance It is publicly known that they are generally fire i in view of three observations taken at 0 econds 30 seconds and 1 minute The angles and ranges noted on these to locate the so called prediction point at the 2d minute and the sit forward point which adds the time of flight of the projectile and is the point at which the shell is simed to fall. In the case of mortar fire with its high trajectory this is between 45 seconds and one minute for most ranges. It is the precise to calculate therefore for mortar fire the future posi-tion of a vessel from one and three

guarters to two minutes ahead. On a straight course the prediction and set forward points come close to the vessels actual course. Figure 7 ahows this fact for ranges between 8 000 and 9 000 yands Inspection of the results shows an average error of 35 yards. In regard to sinuous courses at the same range one finds for a cam course called S I an average range error in the set forward point of about 90 yards in range and 15 yards in deflection. On inspecting Cam 3 course one finds the errors are very great in the determination of the set forward point (am 3 course run at 8 000 yards range shows average errors in the location of the set forward point of 175

The Final Solution of the Airship Problem

Industrial Production of Helium and What It Means in the Future of the Airship

By Ladislas D'Orcy, MSAE.

THERE is a widely spread belief that the war, or rather the sarphano, has killed the airship for the control of the control of

predereken of belium in large qualities and as a compactively low one large, son-inflammable gas, the second lightest income (the lightness being hydrogan), is relatively abundant in all minerals which contain radium, therein, ex unahms, such as theriantle, circuits, etc., but the qualitation of supershing hallom from these embassis has layered such as pract expanse—from \$1,000 to \$65,000 per code feet—bask its use as a hydrogen estimates was more estimated to make the contained of the layer of the feet of the production of the compact of the confidence of the compact of the confidence of the compact of the layer of the confidence of the compact of the layer of the confidence of the compact of the layer of the confidence of the compact of the layer of the confidence of the layer of the confidence of the compact of the layer of the confidence of the compact of the layer of the confidence of the compact of the layer of the confidence of the compact of the layer of the confidence of the compact of the layer of the

then found that the natural gases of Kansas Oklahoma then found that the natural gases of Kanasa Okianoma and Texas contain among other miponents about 1 per cent helium. This discovery was not followed up however. There was no dumand that would have warranted the development of the necessary apparatus. for drawing off helium for the very good reason that this gas could have been used in large quantities only for filling airships—and there did not exist at the time a

filling sambips—and there did not cast at the time a saged Americas as subject to the control of the America However, when the United States declared war on Germany the Butsh Air Board railed the attention of the American government to the fact that one of the important contributions thus on thry could make toward winning the war would be the industrial production of bettime. The problem was provided that the production of bettime, the problem was provided and a swell of which an experimental plant was constructed on engine lines while such of two pomeances cargast at the producwhich an experimental plant was constructed on original lines while such of two companies engage in the preduction of liquid air was induced to build a plant to a combined of the companies of t lines while each of two companies engaged in the produc-

Services should have attached so much importance to the quantity production of helium

On the Drawbacks of Hydrogen

The principal though by no means sole drawback of The principal though by no means sole grawbases or hydrogen is as has been said befor the extraordinary inflammability of this gas. The existence, underneath bundreds of thousands of cubic feet of hydrogen, of internal combustion engines occasionally emitting flaming exhaust gases not to speak of the presence of gasoline tanks has ever been a source of worry to airship pilotswhile it seemed a poor inducement to prospective aerial travelers not with standing the comparatively safe record of the Zeppelin excursion line Considerable progress or the Reppens excursion me. Considerable progress has been made it is true in enclosing the engines and screening off the exhaust collectors, but the risk was still latent because even the best balloon fabries are not wholly as tight and a small quantity of leaking hydrogen

wholly gas ugit and a smarl quantity or reasing nyuvogen would under certain conditions suffice to cause disaster A further element of danger was introduced in that rubbarused fabric becomes self-electrified in dry air and rubbrised fabric becomes self-electrified in dry air and centile sparks when creased in any way—for instance, owing to a loss of tautiness of the gas bags. The attendant rask was overcome by the Germans with the de-velopment of a cotton fabric lined with goldbrakers skin, which apparatily cannot become self-electrified of Amother serious drawback of hydrogen is its ability to form as anylower mixture when sailed with a certain of the control of the con

non-rigid airships because, owing to the single envelope, the studies gases are instantly carried away by the air steam which surrounds the vessel in flight. But on rigid airships where the gas begap proper are surrounded by an outer cover, the ring space thus formed contains more or less stagnant as which garned the surrounded with the hydrogen leaking from the gas the rigid airships another source of danger though it is somewhat beasened another source of danger though it is somewhat beasened

Battleplane Armament

From the Automatic Pistol of the Early Airman to the Multi-Gun Fighting Airplane of Today

 $A^{1} \ LHOUGH \ highly minginarity, writers had predicted buttles in the in-1 tween rivial fleets of airplanes the great nations cut i d the 1 urops an war with little thought of arming their machines. They did not expect$ the gran nations on 1 of the luropean war with thought of arming their machines. They did not ex-battles between airmen fr as they thought there plenty of other work fr armen to perform. So pienty of other wire it arming is perform to with marked military conservations the great powers did not arm their planes and the only weapons the armen had were their automate patche and in reduted instances, infantry or cavalty rifles which were the used in the event of a first chanding behind the en my lines.

the arphane was is kef ipon as a super scout or a sort if wing d cavairy a t ap ak. It was considered quite passible that airplanes might a ive for hombing purposes but the poor results obtain d with the st arrows crude bombs and bembing equipment of the early days served momentantly to convince the military men that the first duty of the airman was that of super scout Meanwhile the Germans had gone deeply into

sout Meanwhit the Germans had gone the matter of military avaision and whin the war opened they were ready to employ their armen in the regulation of artillery fire. Indeed the excilient marketmanship of the long range German artillery at the beginning of the war was admitted to be marvelous by the Ulird armes until they tree learned the art of a risk meeting. too learned the art of acrial spotting

It did not take the French pilots long to get on to acrial scouting and spotting despite the numerous handicaps outrini-ing them. By October 1st 1914 the French airmen were prying into the affairs of the German commanders in the most his high perch the military airman could sketch and jot down notes of enemy dis positions and activities and then fiv back with that invaluable information to he headquarters | this had changed all war

Note the Germans and the Literate armine soon some to the full realisation of the armal scouting activities. Lach ade decided to push its nersal scouting activities to the utmost while hampening the curvey as after as possible. Thus the offeneive and lefement active were intruduced in aerial activities an I soon the planes took machine guina aboard and world furth to be the

the light hearted way in which rival airmen proof the open nearror way in which rives airrine pseed each other in the skew during the opening days of the war merely waving their hands or shaking their fasts at one another they went to a rial billing frest spirit bent on destroying the enemy whenever possible. As early as August 15th 1014 a Pull Schmitt highlane of the Freuch which had been short down by the German antiarread gunners was found to be equipped with a machine gun and 200 cartridges. By November practically all the Voisin hiplanes of the French were armed with machine guns. Records show that the first airplane downed in aerial combat was shot down on October 5th, 19th 19 begeans Frants of the Freend army, in company with his mechanic, Quenauti both of the Fracardille 7-26, composed entirely of Farman pusher biphanes Frants and Quenauti engaged an Arustit beplane at a height of 5,000 feet, and after a few shots the German machine crashed to earth me inttle wood behind to French lane. The pitch had been killed outright by a bullet, while the passenger, a Prussian nobleman died before he could be pulled out from under the wreckage which had burst into flames. During the serial fighting of 1914 not a single French pilot was shot down in serial combat such losses as were incurred being due to fire from the ground which was then particularly efficacious because of the low situade at which the machines were

December 1914, saw the 'fifth arm of the French army formally consecrated to its due share of the great

Morane-Sauinier "parasol" scouts employed in the early days of the war

The airplanes were divided into escadrilles for war. The airplanes were divided into seesdrilles for stategor renonnassances and for change cenery ma-criategor renonnassances and for change cenery ma-criated and statement of the photography. Observation and artilles are considered and the bom-budient excadrilles for the bombing of enemy works the regular routine of military avaistion, and the bom-budient excadrilles for the bombing of enemy works. The Gtranas followed suit as did the Britah whose serial facet was fast developing into a gant organisation from an allowed insignificant showing at the outset of the

From an amous magnificant showing at the outsets the war. The first Fronch change establies were created at the end of 1915. There were few of these fighting units in extence when the Lafayette Lescadrille was formed. April 17th 1916. The change seasofulles. formed April 17th 19th The chaung escadrilles, operating freely in magned sones wer intended to bar the skies for them machines and to provide protection for the army corps machines engaged in routine work Up till 1910, the army corps escadrille was considered

the fundamental base of the aviation system, but the battle of Verdun and the growing aggressiveness of roving

bands of German serial warriors, which came to be known as 'tango circuses and traveling circuses" in some instances proved the system to be utterly wrong when instances proved the system to be utterly wrong when dealing with an enemy having the initiative of attack Accordingly, the chaning ceasifules were grouped under a single command and the immediate protection of the army corps machines was left to the latter, which soon had to assume a more or less defensive stitution in carry-ing on their work. Nevertheless, it was the formation of the separate chaning seasofulles which permitted the Entents armies to most the serial offensives of the travel-ing German exactability, thus restance areals behaves of ing German escadrilles, thus restoring serial balan power whenever necessary guining supremacy of the air at a given point during an Entente offensive, and raising the morale of all Allied airmen all along the line

The single-seater fighter or chaser or scout, as it is

The angle-scater fighter or chaser or scout, as it is variously termed, was born of the demand for a fast and resulty manusured machine. It brought about the great competition between the Germans and the Allies of producing faster and better fighting planes for the scouts, like the battleships of the navy, are the real bases of areal fighting planes power. Ah art fifted may of aerial fighting power. An air fleet may be made up of large numbers of reconnaissance and photography planes, bomb-ing planes and other machines for the

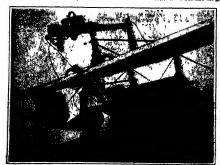

ing planes and other machines for the routine work of search warfare, but when it comes to batting the single-seaters de-termine the issue.

In the beginning the single-seaters were generally monoplanes, and the aircraft constructors made use of the knowledge gaused in developing high speed types for the great races before the war. In fact, the great raous before the war In fact, sobut of the single scate or monocoque Deportunan racers were amployed by the Prench at first, for the roason that they quite outraced sayling the Germans had secure that the secure had to be a good fighter, so the monoplane design was more or less abandoned in favor of fast bulanes which could carry the necessary arms most

How to mount the machine gun so that it could be brought to bear on the enemy was one of the great prob-lems. In the first monoplanes attempts were made to in the first monophanes are mips were finder to mount the machine gun high above the arrman so that its line of fire would be above the aweep of the propeller blades. However such construction was exceedingly awkward for the aerial fighters if not decodedly dangerous awkward for the serial figures: I not decodedly dangerous since the airban had to stand in order to operate the gun, and standing in a machine making better than 90 or 100 miles an hour is not the most pleasant of sansations. The accuracy of one s fire in such a position can well be

imagined

Now the two-centers of those days were also con
fronted with the machine-gun problem. In the "pushir
type, where the propeller is behind the wings the machine
gun merely had to be mounted in front of the observer.

Heavy armament of a Niceport scout. A Lewis gan above and a Vickers machine gun on the cagine cowl

Wresk of a French Pleasers secul, showing the Wolson sincking gan

Such a machine, however, could only bring its machine gun to bear when acting as the pursues: If an eacony machine happened behind it, there was no way or shooting rearward. In the case of the "tractor" rearward In the case of the "tractor" type, where the air-serve, to give it the proper name, is in front of the wings, the machine giu was mounted buhind the pitot and the observer, so as to aboot at any angle bask of the machine But if such a machine happened to be chasing another machine—well, it simply condit at act as a pursuer for the reason that it couldn t attack is the makes and the tractor types were

chms—well, it simply coutant acc as a pursue for the reason that it couldn't attack to the pusher and the tractor types were actomatically obliged to set on the offenance actomatically obliged to set on the offenance obvious, was an awterned state of affairs. The problem of mounting the machine gun in front, even in the tractor design which had come into favor because of (certain tructural and aerodynamical advantages which could not be ascended even for the which could not be ascended even for the machine-gun, which as chip-do, on the engine, cowl directly in front of the pilot. The gun was rigidly mounted, and the pilot, whether in a single- or two-essets ranchins, brought to bear, on the Larget by aming the entire

in a single- or two-easter machine, brought to bear on the target by amming the entire machine. Thus the pilot's hands were left more yo less from the to manage the arrylan, as in more procedul times. The line of fire necessarily passing through the weep to the air server in front, the French placed small pinces of steel or "deflector plates" on the parts of the screw believe to the screw that the parts of the screw believe to the screw the steel of the screw that the parts of the screw the steel of the screw that the screw t bullets as struck the propeller were deflected by the steel binists as struck the proposes were desected by the steel blades without causing damage. Such an arrangement, to be sure, entasted some loss of ammunition, since the deflected shorts were wasted. But the greatest handcosp was in the loss of speed, which is east to have averaged to miles as hour, due to the retardation of the air series.

to miles an hour, due to the retardation of the an earew, and in the graeling competition between rval armen that loss was fat too serious to be permitted to stand. For a time the French mounted a quick-firing cannon on their Vosan "pushers" with the object of more meadly destroying some gant planes which the Germans were employing early in 1915. But the difficulties of earlial markinanship alone compet the use of a machine gut with tracer builets, because of the greater number of chances of hitting the ensemy Again, machine-gut fire is quite sufficient to account for the crew of an arrival control of the control plane, and, with the use of meendary builets, the machine itself. So the accommon, as the French called that

tasell So the coron-conon, as the French called that type, was some abandoned. By now the Germans had come along with an in-genious synchroniaing mechanism, whereby the machine gun, mounted on the engine cowl, could fire through the tractor air-screw sweep between times, so to speak That is to say, by mounting a cam on the engine shaft, riskt is to say, by monating a tan of the ongine shart, and running a transmission system of levers and bell cranks from this tam the gun mechanism was only operative at such times as the line of fire was clear of the air-screw sweep. The Yokker machine which the Germans employed in 1915 and which proved the terror of the Allied airmen because of the heavy toll which its pliots collected, was equipped in this manner. The German pilot merely maneuvered his Fokker until the sights bore on the target, and then pressed a trigger

Typical German chaser—an Albatross in this case—equipped with twin machine guns on the engine cowl

release, whereupon the gun automatically fired between the passing blades. Early in 1916 the Allies were ready to combat the Fokker with the Nauport biplane in which the machine-gun was mounted on the upper plane clear of the air-screw aweep, and operated by a flowden were control on the "joy stake." Thare were xeveral variations of the Nieuport armament, but the standard one was a single Lewis gun with a sangle pan of amountation containing 49 rounds. After discharging the pain or drum, the airman had to come down for another. While the gun performed splendtdly and could be accurately aimed by the sightle on the engine coul in front of the airman that performed speedurally and could be accurately aimed by the sights on the engine cowl in front of the airman the limited supply of ammunition was a serious objection Scop pilots began mounting an extra machine-gun, usually of the Vickers belt-fid type on the engine cowl, using a synchronizing device to take care of the airscrew sweep Other airman preferred two Lewis guns mounted side by side on the upper plane with individual Bowden wire controls Thus if one gun jammed ran short of ammunition, or i crame otherwise inopirative, its mate could be brought into play bill other airmen arranged the Lewis gun on a trunnon so that it could arranged the Lewis gun on a trunnon so that it could be tilted with the butt end in the arrangement was found excellent while attacking a machine from below. In it is, it the same arrangement is still in use on the recent littich %1.5 scouts. The synchronized machine gun arrangement having proved its worth, it soon liveame the standard of all air fleets. All Albed and Graman these is not week.

seaters of the tractor type were an I we still thus armed From a single machine-gua in my airmen have gone to m a single machine-gua in invairmen have gone to mounted side by side on the chance cowl and so alined as to have their fires or set a point a hundred yards or so in front Guns mounted in that fashion can be used angly or in pairs by incurs if trigger controls on the poy stock, and the airman is not so hable to be

caught with an inoperative g in

As for the sights employed on souts and reconnais sance planes of the tractor design these vary from simple open sights to elaborate telescopic sights. The open sights generally take the form of a simple ring with cross wires for the rear sight and a standard topped with a small ball for the fore sight. The telescope sight is equipped with cross hairs. A chin rest r a forehead test is oft in provided so that the airman can steady his head while taking aim

Meanwhile the armament of the two-seater machines of both Germans and Allies closely followed that of the scouts so far as practicable The prevalence of the tractor type gave rise to the rigidly mounted syn chronized gun or guns in front, operated by the pilot and single or twin guns for the observer in the rear cockpit. At first a the pilot and single or twin guns for the observer in the rear cockpit At first a simple goose-neck mounting was employed for the rear gun but the Germans intro-duced a most ingonieus mounting in the form of a revolving ring an adjustable yoke, and of a revolving ring an adjustable yoke, and a stool turning in conjunction with such a gun rest. Thus as the observer swings about to any point of the horizon, the gun turns with him and always remains in front. A locking device permits of first looking the revolving ring in place their locking the yoke rest when the proper elevation has been

obtained and then the gun I his arrangement, variously known as the "tourelle' "ring mount' and the scari yoke" has become standard for all air fleets

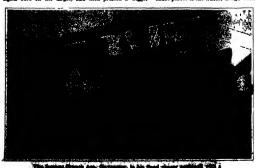

Up till the signing of the armistice the armament of all planes had been pretty well standardized. In the case of twin-engined planes, where the air-screws, being on either side of the body, are not in the line of head-on fire the usual arrangement calls for a tourielle for the front cockpit and another for the rear cockpit. In some in-stances, twin guns are mounted to preclude gun trouble er ra connaissance or general utility planes, such as our DeHaviland I ours, being equipped with a tractor sorew, have a standard armament consisting of rigidly sorrey, nave a standard armament consuting of rapidly mounted gun or guns on the engine cowl, and a tourelle for the rear cockpit. Scouts are unvariably equipped with one or two guns, sither rigidly mounted on the eagine cowl or on the top plane bor the ragidly-mounted guns the air-cooled, beliefed Maxims us standard with all guns the air-cooled. air fleets

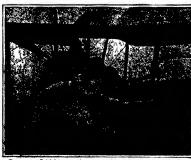

For the tourelle mounting the Lewis gun, stripped of its large cooling tube, has been used by the Allies because of its pans or drums which can be readily handled. The Germans on the other hand, have made use of a modified Maxim with a very light, perforated cooling tube and a reel mechanism for handling the ammunition belt This gun is known as the Parabellum.

This gun is known as the Parabellum. (
In naval aircraft the armament has followed military practice wherever it saitle Such anaplanes as have been actively engaged against U-boats have in many instances been equipped with the Davis non-recoil gun, fring s 13-2 or 3-incl shell 1 he mining of such a gun has both of the simplest, consisting of a saviet and trunnion.

In the majority of scaplanes, however, machine gun have been used. The armament of the large flying beats employed against the U boats by the British and American naval forces, has generally been a tourelle for the front cockpit, another for the rear cockpit, and often two guns firing through port holes in the sides of the huge, boat-like hull

The Principles of Camouflage-I

The Art of Concealment and Deception as Practiced on Land By M. Luckfiesh

A huge Zeppelin shed with roof extending to the ground, eliminating abadew-casting

when pating our wite against that of a crafty prey or a my. It is an art much lier than the human race ir its beginnings may be traced back to the obscurity of the early age of the coolu-tion of animal life. The name was comed by the I reach to apply to a definite art which developed during the Great War to a high state. as many other arts developed by drawing deeply upon the resources of scientific knowl-With the introduction of this specific word to cover a vast field of activity in scientifically concealing and deceiving, many are led to believe that this is a new art But such is not the case, however like many other arts such as that

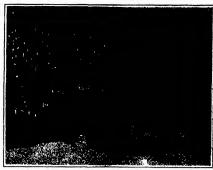

CAMOULLAGE is in art which is the natural argrowth of our instinct for one alment and deception

of flying the exigencies of modern warfare have provided an impetus which has resulted in a highly developed art

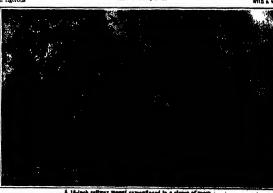

Scientists have recognized for many years, and perhaps more or less vaguely for centuries, that Nature exhibited wonderful examples of concealment and de-Darwin expressed his doctrine, included those individuals of a species who were best itted by their markings and perhaps by peculiar habits to survive in the environ ment in which they lived Naturally markings, habits and environment became more and more adapted to each other until have an increase became in equilibrium with Nature sufficiently to insure its perpetury if we look shout us upon animal life we see on every hand examples of concealing coloration and attituted seigned to deconve the prey or enemy 1 he rabbit is inottled the prey or enemy The rabbit is mottled because Nature a infinite variety of high-lights, shadows, and hues demands variety in the markings of an animal if the latter is to be securely hidden Solid color does not exist in Nature landscapes in large areas The rabbit is lighter underneath to compensate for the lower intensity of illumination received on these portions

As winter approaches, animals in rigorous climates need a warmer coat and the hairs grow longer In many cases the color of the hairs change to gray or white providing a better coating for the winter environment

Animals are known to mimic inanimate objects for the sake of safety For example the bittern will stand rigid with its bill pointed skyward for many minutes if it suspects an enemy Non-poisenous anakes resemble poisonous ones in general characteristics and get along in the world on the reputation of their narmini rela-tives. The drone bee has no sting, but to the casual observer it is a bee and bees generally sting. Some ani-mais have very contrasting patterns which are conspicupatterns which are conspicu-ous in shape yet these very features disguise the fact that they are animals Close ob-servation of fishes in their natural environment pro striking examples cealing coloration.

World Markets for American Manufactures

Edited by LYNN W MEEKINS

A department devoted to the extension of American trade in foreign lands

Our Opportunity in Brazil

DFTILR delivery serves, in at present the greatest need of North American spiritis whiley their goods in Brani and the ripres intaits of a commission home which has branches in South America. We have hundreds of or lors or our books and the consignments are awaiting shipment but there are not enough vessels to take them. At loast 70 000 tons of censuit are ready tog forward as are thousen is of I illum worth of agricultural implements also unstung machinary and show more than the standy imputed in the processing the state of the standard processing the

Broat is one of the largest and rechest countries in the worl and apportunities to develop its resources are unlimited. The Branilans are more friendly to us than see any other people of I still at America. A market in which (armany was strongly intronched before the war, Brasil offer many chance to day to American manufacturers. The typowriter is one American product that is making considerable headway just now 'since last summer the Brazilian Government has permitted contracts with its various departments to be presented in typewritten form. In the past documents of all kinds have been written by hand but this practice is being abandoned since the advent of American salesmen who have introduced standard typewritting medianes and have organized schools where stenography and typewriting are taught.

American Dental Equipment in Wide Use

For some years the United States has empyed a very satisfactory part of the Brazilian trade in dental instruments and supplies. Nearly all of the 1500 elentates in Brazil are natives of that country largely because of the raid examination gives in the Portuguese languag that must be passed blorder dentatry may be practised. Dental purlows in Rio de Jamoro are like tinese in the United States as most of the equipment is of Anurecan manu active and a man who has live in that facture and a man who has live in that facture of distall chairs increased their prices German made chairs of inferior quality solid at a nutch lower figure were cutting into our shane, of the trade just before the war. Customs lutters we light and Brazilian importers are better able to

before the war where same better able to dispose of the less expensive chairs. In great cuttral part of Brazil is the least known of any section of the world Although literally darker than Africa is not lacking in molern requirements for one thing sawage disposal systems are

needed which means an excilint opportunity for the development of trial in pipes and machinery for such plants. The agents of American frine who have vasited Brazil have 1,cit too print to confine their attention to the large coast critics and have neglected the interior of the country with reference and the reasons of live stock tries the Government has removed the import duties on farm implicitly and and on proceeding the stock of farm implicit and and on pure 3-red cattle and horses

Brazilian Cities Are Well Lighted

As an industion of the extent of the market for elerated supplies, in the state of Wo Paula olane 180 crises recommended with electric lighting facilities. It is experted that American electrical irons to materia and other devices could find an increased sale in Rio Grande of Sul through intelligent sales methods which would include correspondence with dealers conducted in Portujuece, the sending of attractive literature accompanied by a statement of terms prices and discounts and the supplying of data showing the volume and weight of goods packed for export. In this section of Brail, German houses have been successful un controlling most of the importation and distribution of foreign goods But this has not prevented the sale of American electrical

of the importation and distribution of foreign goods. But this has not prevented the sale of American electrical supplies, which have proved their superiority. Brazil is a good market for American drug products and pharmaceutical supplies. It is said to use more permitted in the same of the sa

proprietary medicines are popular in Brazil, where the people are noticeably inclined to use such remedies for their allments. In the city of Rio do Janeiro there are more than four hundred retail drug stors and every village has at least one such establishment. Mediced milk and grape junes are typical American articles that have been sold successfully in the larger cites of Brazil The best way to place American products of this sort on the market is to send travelling aslament on introduce the goods and appoint competent representatives Some American manufacturers have established branch fastocles

Market for Paper and Other Products

Hraul as the second largest consumer of paper and paper products in South America importing more than \$14,000,000 worth in 1916, but the outlook for an increased trade in this line is not by meniang because of the country s slow educational development. About three-fourths of the population can neither reas nor write like expansion by the Braxiban Covernment of the public school system would result in a larger domain for paper and for many other commodities. In two of the three great manufacturing ottes of Sunth America—Rio de great manufacturing total soft sold field for the sale of undustrial machinery, sepacially that of an intrease nature.

Our manufacturers need more direct representation in the important trade centers of Brazil" declared an American trade commissioner just returned from South America We need also a fast and regular frught

A display of American dental goods in Rio de Janeiro

service to all the primopal ports. Without it we are as errippid as a department store that depends upon causal message, buy to make its deliveries. To obtain more Brazilian business we must extend more satisfactory credits Brazil has every natural resource that the Inited States has and others in addition. The investment of the states has and others in addition. The meret create the largest single incentive to our trade with Brazil. We must pay more attention to advertising Publicity methods in Bouth America may be compared to those prevailing in the United States thirty years ago the application of American diseas would make Brazilian advertising more effective and result in making thousands of our products as well known as the comparatively few American goods already standard with Brazilians. If they knew us better, the people of Brazil would buy more from us, but they have hardly any consciption of our national Mes. At the present time they are interveted in as and have met us half way by ladicating their friendship."

The Renaissance of Commerce

THE business of war, prish has dominated the world for the last four yeste, is now giving way to the business of pases, which will be by no mans a passeful business. The war should the flust off the world's trade and in its newness sell brightness it is a wonderful and a dangerous thing—worskerful in its possibilities for the manufactures and exporters with knowledge and vision, and dangerous for these, without such qualities.

In foreign trade nothing should be taken for greated Its changes are kalesidoscopie, its conditions ever varying, and he who would not keep up with the dissess had better stay out of it. There are very range manifections of our selling anything in Europe. They have read so much about the preparations for size the war that England, France, Germany and other nations have been making that they have deceded to draw into thus shells so far as selling American goods in that part of the world is concerned. They still think that the American manufacturer who pays his workmen with collars is unable to compete with the European mannfacturer who pays for his labor with france, leaving out of connected that the United States has the world of the state of the st

many cases

Very soon we shall have to increase our sales abroad

or else face an indefinite period of hard times. Face

tores cannot be kept going unless the orders on hand

are sufficient. The failure of a number of our manufacturers to realize the importance of foreign trade

has thoroughly discouraged quite a few trained foreign

representatives from handing American goods A man

of long commercial caperience, born in Greece, whas spent more than ton years in the United States,

complained bitterly the other day about the lack of

interest in export bunness that he found in Americas

industrial circles. He got in touch with a handred su
tores, offering to open a well-equipped

tories, offering to open a well-equipped building in Ahens where their products could be displayed and saking them to let him have samples of their goods, for which he agreed to pay, and descriptive actaliques. Although the man know the Near East from A to Z and has ample capital to finance the understaing, he received only two replace, but one of which the control of the

vas inversible

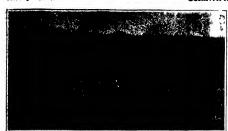

'I can' understand why American exporters are not aware of their opportunities in the Levant,' he said 'The United States will have excellent shipping faculties when its new fiest is built, and it will be me easy matter to inaugurate a steam stall in the said of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the trade of the Levant in the hand of the Levant in the Leva

there, which means that direct trade is the most way that American goods can complete with those from hurope. If the manufacturer will study the geography of America, be well find that Egypt centrains something more at \$1,500 an acce and a full measure of property dies at \$1,500 an acce and a full measure of property dies to the high quality cotton crop, Leypt is a spirited bidder in the foreign market. Its purchases from the United States have increased very considerably in late years, and it is a field to which more stention should be paid. Our trade with Egypt has been handlespeed in the past the property of the

by the inex of circuit seasmanp innes.

Our new forcing counterers will carry into all parts of
the world many lines of American goods which used to be
restricted to comparatively few markets. We are now
sending abroad numerous commodities that we did not
export at all before the war and some that we did not
previously manufacture. Uncle Bam's general store
has added tots of new department. He can sell to his
foreign customers a greater variety of lines than ever,
thanks to the vext industries merry devaluous.

has added lots of new departments. He can sell to his foreign entromers a greater variety of lines than ever, thanks to the wast industries newly developed. We have also progressed in the manufacture of changicula, and instead of something just as good as those we much better. With the direct sent immug out something much better. With the direct sent immug out something from we orders, their profitable operation department of the extent to which are foreign buleases replaces. She military demands of the period now endless. Convoluplanating, bessed upon accurate information, and a gession degree of friendliness toward prospective unstoness size essential in the new order of change.

A highway bridge in Wisconsin and its twin brother. The use of the existing plans for the second structure was made possible by building it on dry land and diverting the river to flow under it

Quantity Production in Bridges

A COUPLE of years ago re discussed briefly the Question of separatine crossings, and showed that, whether the crossing were at grade or above or below, operating safety required the road to run in a single straight line, to include both the crossing itself and a considerable distance on either side. We pointed out that when this requirement was not meet, the leasened first cost of constructing a perpendicular crossing, compared with a long diagonal ones, was properly to be regarded as a secondary matter, as against the cost of maintenance and the great dangers of the serpetities

recoming the many situation comes up frequently in building a bridge. The read approaches and leaves the river at a considerable analy, or at a point where the river bends in such a way set to give a long crossing. If the bridge is such a way set to give a long crossing. If the bridge is such a way set to give a long crossing. If the bridge is such a way set to give a long crossing. If the bridge is such a set of the read and the set of the read, one at seah of the bridge, in order that the latter may be of minimum length, we are but lending our troubles to the future.

The bridge ungineer has a way out of this dilemma way through which the constructor of a rail-highway crossing cannot follow him. The railroid is permanent feature and cannot be shifted; but it is a simple matter to prove the construction of the property of the property place. Bot this is what the bridge engineer closs, he smaply redocates the triver at the point where he can bridge it myet conveniently and erronnessily.

simply relocates use river as use point were us one in mait most conveniently and economically.

Indicatally he derives another advantage from this procedure. Instead of first moving the stream and then building the bridge, he builds the bridge and then diverte the stream to flow under it. Obviously it is not a very

the stream to now below the build a bridge of ordnary sase entirely on dry land—we could not go out of our way to do this But when it comes to a question of whether we shall build our bridge on dry land, or build a river first so that we may we shall estantly decide in favor of the former alternative, and make it good for such incidental advantages as it possesses it may, however, be supplained that its economists or purely indicated, the log saving, the bed difference between the cost of diverting the cost of diverting the cost of diverting the river and that of building an unnecessarily long bridge and that of building an unnecessarily long bridge.

pylyting the procedure or intuned, has recently despontuned, has recently despontuned and the procedure of the trained still another positivated with another positivated and the procedure of the Whose me shill a bridge at whatever point we happen to come upon 1 he maker, as whatever point we have proting to the procedure of the procedure of the proting to the procedure of the state of the proting to the procedure of the state of the proting to was done in one of the cases illustrated when we get around to the job of relocating the river we can make the width of the waterours. What we pieze—within limits, of ourse That being the case we can dig into our files for an axiating bridge plan and when we find one that we ike and that comes within the limits of the present case, we can accommodate the renovat I stream to it instead of going to the expanse of disagong a branch new bridge of the stream.

This is actually being down in Wisconsin. The two bringes which we plettur are located one in Artingo and the other near Manstown the natural spans, if the internant had in both cases here in it is undistricted would have been quite different in kingth and height of spans, since the profiles of the vallety were sholly different But in revising the river at Arting 18 was any to provide the transfer of the Arting 18 was any to provide the transfer of the Arting 18 was any to provide the Artin

Surgical Machinery Up to Date

IT is almost a common place to remark that the war has reduced surgery t a precise mechanial art Negertheless as the various devices for emverting the hospitat into a machinesh p pass in review the living will hardly be able t r ta completely the garl of so phistication or t r strain altogeth a some expression of surprise

One of the latest exhibits of this sort of thing is the arm splint which we d the listrate hirewith It is obvious enough that this splint gives the

ary degree of rigidity but here it merely duplicates existing devices instead of surpassing them. Its adinstead of surpassing them. Its advantages consist in the fact that it can be used on either arm indifferently and can be adjusted to any desired position of the arm and of the wearer

The new splint has been ordered in quantities for use in our base hospitals ere and abroad and it is violating no dictate of military secrecy to state that the American Red Cross is responsible for its design and adoption. The advantages of having one spirit applicable to all cases of arm wounds are so obvious that we need not dilate upon them here It is just the same game of standardised trucks and standars id airplane engines all over again, on a smaller scale

Weighing the Temperature for **Blind Folk** By Jacques Boyer

THE victims of blindness whose number the war has unfortunately so in creased, excite more and more the instrives to ameliorate their lot by provid ing them with a variety of useful ap-pliances. In the course of the past few years various workers have adapted to the use of the blind certain machines tools and even games the Braille slate and the Braille typewriter furmsh in-stances selected at random Today comes a rendent of Nimes M Fleury Brunet with a curious thormometer that he has invented to make it possible for persons deprived of their sight to read the temperature quite as well as

anybody else
The device is a calorimetric balance

with which one actually weighs the temperature if we may be permitted this expression s a combination of a balance beam with a mercurial thermometer using the motion of the mer eury column to displace the center of gravity of the tube and permit the bind man to read, from its position, the degrees of tem perature marked on an index scale

The inventor has worked out his conception in a fashion at once elegant and sound The scale is

The standardized adjustable arm splint

bers along which it can be slid for a short distance backward and forward It is graduated in Braille characters, the lower temperatures being above and the upper once below The principal member is a rather heavy bar of aluminum, supported, on a knife-edge bearing, at a point near one end On its long arm it carries an ordinary mercurial ther-

How the new splint goes on the patient

for whatever temperature is to lie in the and die of the instrument's range—which ordinarily runs from sero to 40° Centigrade. The column of mercury then grade The column of mercury sun-plays the role of running we git, and by its varying position it controls the position of the balance—when the temperature rises and the mercury moves outward along the beam, the pointed

The thermometer that weighs the temperature so that the blind can read it

mometer rigidly mounted, and this arm terminates in a point. The short arm ends in a heavy ball and is provided in addition with two blocks which may be slid back and forth and locked in position This makes it possible so to minum beam takes a horizontal position

end of the latter falls, and in the opposite CAMO IT ITSOS

case it mes.

The point of the beam falls to touch
the scale in the normal position of the
latter When a blind man wants to
read the instrument, however, he pushes
the scale in toward the base, and as he
does so, the pointed beam passes through

one of the holes of the see and penstrates a little w on the other side. It is the looked in position, and it blind man can find it and pe the corresponding Braille character without any danger of displacing it and altering the accuracy of his reading. Having found the tempera-ture, the blind man moves the scale back to normal postion, and the pointer is again free to oscillate under the influence of temperature changes Inability to read the tem-

perature, while not the worst of the blind man's disabili-

ties, is far from being the least annoying, and this olever means of removing it will be appreciated.

A Stretcher That Gives Up Its Lead Painlessly

Paintensty

In the stroke made during the past decade by medical selence and surject gray, little sitemtion has been paid to one of the minor, but nose the less urgent, points in the heading of the injured—the means of gotting them off the stretcher and into the bed Every doctor will concede that the current style of heading not be painten in this transfer leads to irritation and shock which, in severe cases, may become a serous complication in this

and shock which, in severe cases, may become a serious complication. But there has been no suggested means for avoiding these unpleasant consequences. The stretcher above on this page duvides longuitudasly in the middle Each half of the caarvas may then be sloped from under the patient, after he has been deposited, in the stretcher, on his bod or oparting table, so the transfer takes place with no handling and no shock

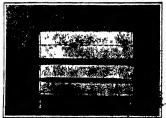

takes place with no nanoung ann no shock.

The center coupling of the new stretcher consusts of two fine steel rods, three feat to two fine steel rods, three feat steels and the stretcher through can var loop of the stretcher through can var loop of the stretcher through can var loop and are locked in place by a canvas strap that buttons over their outer ands in much fashions as abolitely to prevent their slipping out, while said rod checks the three fallings out, while said rod checks the fallings out, while said rod checks the fallings out, while said rod checks the fallings of the stretcher to six feet, making delivery possible to the standard hospital bad, sax feet two fashes in length.

The iron spreading rode have a slot at the center of one which slips over a rivest at the source of the opposits rod.

rivet at the center of the opposite rod and, when rigidity is in order, is locked

by a pin per both rods both rods. To pin in turn is he in place by a sm that steel apping.

The stretcher that divides down the middle to give up its

appright 1919 by The Goodyen; Tire & Builder Co.

"In this test of nineteen months we have demonstrated to our full satisfaction that your Goodyear S-V Solid Truck Thres give us a high general average mileage and a low general mile cost per tire, and their stamina has stood up where the strain is the hardest."—W. J. Sherwood, Gen'l Supt., Chicago Motor Bus Company.

As a result of the extensive test mentioned above, 90 per cent of the tires on the fifty double-decked busses operated by this company, are Goodyear Solid Tires.

This is because, although the balance is always made up of other tires for direct comparison, no reason has been found for changing.

The superiority of Goodyear Solid Tires

is most conspicuous at the points of hardest wear which are the front wheels of these busses. They are the driving as well as steering wheels. Their tires receive the worst struns imposed by the 10,000- to 16,000-pound burdens above them.

Out of 342 Goodyear Solid Tires checked, thirty-one ran between 15,000 and 23,000 miles, eleven went 20,000 to 25,000 miles, while four exceeded 25,000,

including one old warrior known to actually deliver 37,665 miles.

Nearly fourteen million tire miles have cost The Chicago Motor Bus Company only one-half cent each.

Such economy could be produced by nothing less than the tremendous strength built into Goodyear Solid Tires, by reason of which they wear down very slowly and evenly.

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO

TO INVENTORS

The completion of substantial war orders leaves the undersigned company with largely increased facilities for the production of metal stampings and drawings of all kinds.

We desire to utilize these facilities in the development and manufacture of some patented article of merit, preferably one which is now in general demand and which can be turned out in large quantities

Behind such a proposition we can place our large plant, ample capital, solid reputation, and long experience

Correspondence with Inventors is solicited

TIMKEN TAPER

of the "cup" of a Bearing is tapere

Bearings that Stay New in Tractor, Truck and Motor Car

"As good as new" after five thousand, twenty-five thousand, fifty thousand or even a hundred thousand miles in motor ear, truck or tractor.

Why is this characteristic of Timken Bearings so important to car builder or

And how does it follow from the tapered design of the bearing?

Here's why it's important:

The job of the bearings-in wheels and transmission, on the pinion or worm shaft, at the differential or in the knuckle heads is to keep the expensive working parts of the vehicle from wearing out. Bearings can't do this job if they wear out themselves, or even if they just wear loose, and stay loose. Therefore they should stay new—and Timken Taper Bearings do.

The tapered design enables the bearing to resist not only up-and-down loads, bumps and pressures, but also the heavy side or end-pressures that are always present in some degree in a moving vehicle—jolted to right or left, swinging around curves, struggling out of ruts and bumping over holes, stones, and so on.

Naturally, with this doubled power of resistance to wear and tear, Timken Bearings stand up where less resistant bearings would be ground to pieces.

Secondly—if a little wear does occur after thousands of miles, it can be quickly and easily corrected, just by moving the tapered "cone" and rollers a trifle farther into the tapered cup. This simple "take-up for wear" extends the life of the bearings indefinitely.

If you want further explanation write for motor cars.

INVESTM ENT VALUE

Curved or "S" Courses (Community from graps \$8)

of 12-inch guas the prediction interval is only 40 seconds and time of flight from 15 to 40 seconds and time of flight from 16 to 40 seconds The error appears to be proportional or nearly so to the time inter-val at a high the future position of the sinp on the 8 course must be guessed. On a straight course the average error in the ast-forward point is about 24 yards. With forward point is about 24 yards With the target hand-on when steering in 18 ourse at ranges between 7 000 and 12,000 yards the total probability of hitting is reduced by 25 per cent and with the target brea laid the sanous course at 8 000 yards range reduces the longitudinal probability of hitting about 10 per cent At the longer ranges 18 000 and 21 000 yards, the sinuous course will give an attacking fleet more immunity than now from rifle fire When sj. thring is resorted to the error will be far greater even than that indicated

The importance of these tests cannot be too stringly emphasized. As the mor-ter and guider from a land battery having a long horizontal and high vertical base line at 8 000 yards range was seriously line at 8 000 yards range was seriously affected him much more will be the affect upon guafiring between battle fleets at 19 000 yards range which resort to spotfiring! A fleet on an 8 course will be much more immune from the enemy a guns while her own control officers knowing the 18 course can after their ship's fire as the curve changes.

The Final Solution of the Airship Problem

(Continued from page 78) owing to the fact that the outer cover is owing to the fact that the outer cover is made as a rule of a non-gas-tapit material thus silowing for some renewal of the air certain constructors boriaum for instance provide means for ventilating the ring space at will by means of a system of valvas Of course all these are merely peace time risks which in time of war are further complicated by the intervention of hostile airplanes firing incendiary bullets—as the list of German Zeppelin losses proves with considerable forcefulness—It is small wonder then that as long as the industrial production of behum had been considered production of neutum and been considered impossible the airship should have been condermed for all but some special pur poses more distinctly navel fleet scouting coast patrol and submarine chasing. It is perhaps not unfitting to add bere in view of what has been said about the drawbacks. of hydrogen that the officers and crews manning airships in time of war are ex-ceedingly gallant men—be they even

Battleplane Armament (Continued from page 75)

The armored plane has appeared on various occasions in the great war, usually on the German side Such attempts to on the German sade Such attempts to protect armen and engines have generally proved a failure for the reason that th loss is speed and climbing ability has much than offset the gain in protection from hostile small-arms fire Indeed, such hostile entail-arms fre Indeed, such machines have only too often fallen votume to artillery fire from the ground A typical armored plane designed by the Germans for operations against troops on the ground was brought down by the Americans during the closing days of active fighting. This machine, which was probably of the Junker type, was a two-seater and carmed three types of the property of the state of the property of -one firing directly ahead, one mount d guns—one firing directly ahead, one mount don a tourelle, and the third attanged to fire through a well in the floor at targets on the ground

All in all, the tendency has been to in

All in all, the tendency has been to in crease the machine-ginu wherever feasible but considerations of speed and elimbing the control of the

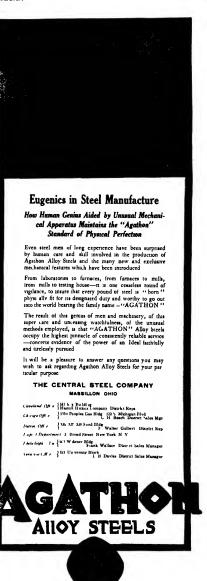

The Principles of Camouflage (Continued from page 76)

plane, aeral photography became a more important factor than visual observation in much of the reconnuisance. This neces-sitated that camouflage in order to be accessful had to meet the requirements of the photographic eye as well as of the human ave. In other words the second the photographic eye as well as of the human eye. In other words the spectral characteristics of the colors used had to be similar to those of Nature's colors. For example, chlorophyll, the green coloring matter of vegetation, is a peculiar green as compared with green pigments. When examined with a spectroscope it is seen to reflect a band of deep red light not reflected. by ordinary pigments So a photographic plate or spectroscope will reveal a differ-ence which the unaided eye does not Some time before the Great War began

it occurred to the writer that colored filters could be utilised in aiding vision by in count De utuned in along vision by in creating the contrast of the object to be viewed against its surroundings. Studies were made of various filters, in view ing the uniforms of various armics. Further ing the uniforms of various arms: Further developments were made by applying the same principles to colored lights and painted pictures As a result of the demand for avoiding detection by photographic plates and by various colored filters, some paints provided for the amountlear were developed according to the appetral ro developed according to the apearan re quirements. Many other applications of senance were developed so that camouflage can now be called an art based upon sound

can now be called an art based upon sound seantific principles

Natural lighting is so variable that it is ofcen impossible to provide exancidings which will remain astudedory from day to the control of the control of the control to provide the best compromise. total light received by a horizontal surface at moon. Light from the sky and light reflected from the surroundings illuminate the shadows. These shadows are different in color from highlights because color be-comes less comprisons as the distance of observation increases. In general distribution of brightness of light and shade in the most important aspect to be comsidered

The camoufisur worries over shadows The camoussur worries over singulars more than any other aspect generally On overcast days camouslage is much more successful than on sunny days Obviously countershading is resorted to in order to sliminate shadows and where this is unsuccessful confusion is resorted to by mak-ing more shadows The shape and oriening more analows 1 me anape and oren-tation of a building as very important to those charged with the problem of render-ing it monspicuous to the enemy, but little attention has been paid to these aspects

those charged with the problem of rendering the monganeous to the seamy, but lattice attention has been paid to these aspectation of the problem of the problem of the problem of the factory dull green will be detunguabable by its shape as indicated by its shape as indicated by its shadow and shaded sides In this some a hangar for example, would be more reachly concealed it its length lay north and south Its sides could be brought with a gradual ourve to the ground and its rare, which has concealed it its length lay north and south Its sides could be brought with a gradual ourve to the ground and its rare, which has effectively treated to conceal the shadow A little thought will convenie the reader of the importance of shape and ormentation. Broken color or pattern is another fundamental of camouflage which, of ourse, must be adopted to its environment. For our trucks, cannon, and many other implements is that of the blacking of these colors at a distance, where the eye no longer receives the individual patches, to a color which attendates the general law. For example, red and green patches at a first patched and green patches at a classification of the patched of the patch

In constructing such a pattern of various colors it is also desirable to have the final mean brightness approximate that of the general surroundings. This problem can be solved by means of the photometer and a formula provided which states, for example that a certain percentage of the total area be painted in gray, another percentage in green, and so on The photometer has played an important role in establishing the scientific basis of camou-

meter has prayed an important one of establishing the selectific base of camourtees.

Where the artist is concerned with a background which does not include the aby, that so, where he deals only with silventened objects on the earth, his trained eye is valuable provided the colors used meet the demands made by photographic plates and colored filters. In other words, the sky as a background, gives trouble to all who are unfamiliar with scientific the sky as a background, gives trouble to all who are unfamiliar because of sky and colored sites or the colored size or the colored size of the colored size or ordinarily encountered. One of the most conspicuous aspects of Nature's surface is its texture From great heights it appears flat, that is, polling land is fromed out and the general contour of the ground is flattened. However, the slament of texture always remains. This is the oblicit reason for the extensive use of

the other media used. When viewed at some angles the glint or highlight due to specular reflection renders the work very conspicuous For this reason natural foliage or dyed raffia has been used

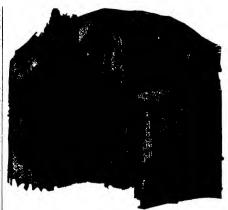

Systems of network have been exten-sively employed on roadways near the front not for the purpose of concessing from the enemy the fact that the roadways exist hut to make it necessary to shell the entire roadway continually if it is hoped to pre

vent its use

Although the camouseur is provided with a vast amount of material for his work many of his requirements are met by the material at hand Obviously the most OTAL DESIGNATION SOLVEN convenient method of providing conceal ment for a given environment is to use the materials of the environment Hence rubbish from runed buildings or villages Upright Drills supply camouflage for guns, buts, etc., in that environment. In woods the material hand. The color of the soil is important for if it is conspicu ous the camoufleur must provide screens or natural turf

In this great game of hoeus poeus many deceptions are resorted to Replicas of large guns and trenches are made, dummy soldiers are used to foil the super and make him reveal his location and paper make him reveal his location and paper makeh horses, trees, and other objects con-ceal snipers and observers and afford latening posts. Guinners have been dressed in summer in green flowing robes. In winter white robes have been utilised. In the foregoing only the highlights of a vast art have been viewed but the art is still vaster for it extends into other fields Sound must sometimes be camouflaged and this can only be done by using the same medium—sound. In these days of scientific warfare it is to be expected that the warfare it is to be expected that the positions of enemy guns would be detected by other means than employed in the past A notable method is the use of velocity of A notable method is the use of velocity of sound Records are made at various stations of the firing of a gun and the ex-plosion of the shell By ample tray-nometric laws the position of the gun is ascertained it is said that the German-fired a number of guns simultaneously with the Temple is in order to experiwith the 75-mile gun in order to camou-flago its location The sirplane and submarine would gladly employ sound camou-flage in order to foil the sound detector if practicable solutions were proposed

The foregoing is a brief statement of a new of the fundamental principles of land camouflage. Let us now briefly consider the eyes of the enemy. Of course, much concealment and deception is devised to concealment and deception is devised to foul the observe who is not the ground and fairly close. The procedure is obvious to the average imagination however, the reader may not be acquaited with the actial cyes from which concealment is very important. As one ascends in an arrighas to view a landscape he is impressed with the madequacy of the eyes to observe the vast number of details and of the mind to retain them Field glasses can not be used as satisfactorily in an airplane as on the ground owing to vibration and other moveground owing to vioration and other move-ments. The difference is not as great in the huge flying boats as it is in the ordinary airplane The camera can record many details with higher accuracy than the eye At an altitude of one mile the lens ca used at full aperture and thus very short exposures are possible. This avoids the difficulty due to vibration. When the difficulty due to vibration. When the plates are developed for detail and enlargements are made, many minute details are distinguishable. Furthermore, owing to the fact that the spectral sensibilities of photographic emulsions differ from that photographue emulatons differ from that of the eye contrasts are often brought out which the eye would not see This applies also to camoufage which is devised merely to suit the eye Individual footparts have been distinguished on prints made from negatives expected at an altitude of the contrast to the process of the property of the contrast process of the process of the process of the contrast process of a tree from its dramp of these parts are the process of a tree from its dramp of the process of a tree from its dramp of the process of a tree from its dramp of the process of a tree from its dramp of the process of a tree from the dramp of the process of a tree from the dramp of the process of a tree from the dramp of the process of a tree from the dramp of the process of a tree from the dramp of the process of a tree from the dramp of the process of the process

Back To Civil Occupations

Unlike cannon, rifles, shot and shell, the usefulness of the wire ropes engaged in war work did not cease when the fighting stopped. Like returned warriors they will be mustered out and engage again in their normal occupation of construction and reconstruction.

In rebuilding the davastated portions of Burope in bastening the construction of eagineering projects long delayed in this country were ropes will play their silent, all important part

Again will Broderick & Baseom wire ropes be found mining, logging hoisting great beams and conveying materials of all kinds in a peaceful industrial world

The Panama Canal, the New York State Barga Canal, tha Woolworth Building are well known monuments to their pre-war activities. Their post-war work will be equally as important

There's a brand of B & B Wire Rope for every purpose Our Yallow Strand is not exceeded in strength by any wire rope of the same diamater and equal flexibility.

The man in your town who knows Motors

EVERY city and large town has its GE Motor Agency

You can depend on the G-E Motor Agency man a thorough knowledge of the application of electric power He does not rely on guesswork—he knows horse-power ratings, types of motors and the correct control.

The business of the G E Motor Agency man is to conserve power, increase production and add to the profits of his customers. The door of every industry in his community—from the "electric slose repair shop" to the big manufacturing plant—is wide open to him for what he knows and the way he serves. And not the least of his assets is the company behind him, building more than 500,000 motors a year and whose foremost engineers he can fively consult.

Call on your local G-E Motor Agency man—he can meet your power needs either by the installation of new motors or by rearranging motors and machines without necessitating the purchase of additional equipment.

New Test of Transportation Efficiency for Packard Owners Starts February 1st

Test Covers One Year's Operation—Drivers, Accountants and Shipping Clerks to Share in Cash Prizes of \$17,640.00

How much work can a motor truck deliver? What ought to be the cost of doing the work?

HESE are two of the most pressing questions in American business to-day—what with the railroad congestion and the need to save freight cars; with the staggering quantity of mer-

cars; with the staggering quantity of merchandise to be moved; and with the great business expansions already taking shape.

Motor truck efficiency means not only gasoline economy, tire and oil saving, and repair economy.

It means also the right size truck for your average load; efficient routeing; saving of time in loading and unloading; the way the truck is handled all along the line.

It means standardizing costs—every item fixed and known.

Basic principles, all of them—and the purpose of this new National Truck Efficiency Test is to show the Packard owner how these basic principles can be applied to his individual business. The test covers one year's operation—demonstrating what can be done under all conditions of weather, temperature, road and load.

The Packard owner may enter as many of his Trucks as he wishes.

Prizes are not only awarded to the *Driver*, for keeping his cost down in relation to his service; but to the *Accountant*, who tabulates the records; and to the *Shipping Clerk*, because much of truck efficiency depends on efficient work at the shipping platform.

A Packard Truck of any sise can compete on a fair basis. Trucks are classified according to capacity into Divisions.

Here is where the owner will learn whether his truck is just the right size for his work—or too large, power lost by running on underload—or too small, necessitating overload to get his hauling done.

The Packard owner starts the test with the basic principles developed by the Packard Organization of transportation

He has a year to apply these principles to his individual business.

specialists.

What can he not achieve in . efficiency!

How to Enter Your Trucks in the Packard National Truck Efficiency Test

Your local Packard Branch or Packard Dealer will accept your entries and see that your Packard Truck of Trucks are formally enrolled on the Official List of Contestants

THE Test starts on February 1st, 1919, and continues to January 31st, 1920.

Trucks are divided into seven Divisions,

"A" Division—all 6-ten Trucks
"B" 5-ten
"C" 4-ten
"D" 4 1-ten
"E" 4 1-ten
"F" 4 1-ten

The Grand Total of Prizes is \$17,640.00 - including five prizes for Drivers, Accountants and Shipping Clerks in each Drouses—as follows:

Paravane hasied out of the water, showing the hinged cutting jaw, plane member, rudders, and floats

This paravane caught a small shark instead of a deadly mine in its cutting jaw

The Paravane-A Steel Shark Which Protects Vessels in Mine-Infested Waters

Vessels in Mino-Intersor waters

THE naval mine as a far more treacherous weapon
than the torpede. It gives no warming of its presence
as it swings some distance below the surface, ready to
strike a crushing blow the moment it is touched by a
ship. In the great war the mine has scounted for
many ships, among them the British dreadnaught
"Audadoins" and the American crusser "San Diago,"
the latter having been sunk off the coast of Long island
indeed, the German, fully resting the "betterenes of
the marks into enemy waters with the
object of sowning mines at the entrance
of harbors and in the well-known
shipping lanes.

est harpors and in the shipping lanes
But whatever may have been the destructive qualities of the mine as compared with the torpedo its actual arealy cur-

destructive qualities of the mine as empared with the torpsed or its actual effectiveness has been largely cruzilled by the introduction of a protective derive for vessels crossing mine and the parawane, and it is moorn as the parawane, and it is reported to have been instrumental in making the German mine fields more or less impotent against Allied vessels. Brisky described, the parawane may be said to comprise a hollow torpsed-shaped body, a plane member temulating in two floats, horacontal and wetled to the said of the said o bow is about ten feet below the sur-face, and each persyma maintains a parallel course about twenty-five feet sway from the ship's side. As they are being towed at a depth of about ten fact, the persymane can be plainly some from the deck of the ship, hav-ing much the appearance of sharks.

The plane member and the rudders of the paravane, as The plane member and the rudders of the paravane, as well as the position of the towing cable maintain this device at the proper depth and hold at to the parallel course. Audie from the towing cable there is another cable connecting the paravane with a small boom or dart on the for eitle. The purpose of the cable is to hauf in the paravane, as well as to operate the cutting aw in the more recent my this. Phe hauling call is in pulled taut while the other call is a practically free from stram examt when it is working the cutting the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when it is working the cutting the stram count when the stram count w stram except when it is working the cutting law

Given two paravanes and two taut cables which form a V-shaped fender at the bow of a ship it is a simple matter to understand what happens when such a com

bination enters a mine field. The mines, which are anchored to the sea bottom by means of steel cables, are taken care of as depicted in the sketch. The paraare taken care of as drotted y me and a feet each care of as a choice of the care of as a choice of the care of th

more recent form the second cable of the paravane extends from the jaw to a winch on board the ship. The winch is arranged to operate continuously, but allows the cable to ship each time it has been wound up tightly. Thus the cutting jaw, which is hinged in this case, is alternately opened and closed so as to act as a pair of power-ful shears.

Most ships traversing mine-infested waters have been equipped with the waters have been equipped with the paravane American transports have all been equipped with the device The "Leviathan," for instance is understood to have carried four understood to nave carried your paravanes on each trip, two for use in mined waters and two in reserve At the high speeds made by this giant transport much troutle has been ex-perienced with the paravance, and it is said that a trip was seldom made in which two or three were not lost in fact, it is the difficulty of handling the paravanes on high-speed ships that has often tempted the crew to get along without them although they are recognized as a reasonably sure form of mine protection. On slow vessels, however, the paravane is readily managed

Arrangement of puravanes on a ship traversing mine-infected waters

The bjet of this jurnil to to record accurately and lucidly the latest evertific mechanical and industrial news of the day. As a ucokly jurn it is in a post tion to announce interesting developments before they ars published elsewhers

The Edstor is glad to have submitted to him timely articles suitable for those columns especially when such articles are accompanied by photographs

A World in the Re-making

ITH all Furope busy in reconstruction and has so enshrouded the activity of the past four years a vast store of interesting and valuable ma ternal is to be had on the other side of the water have sent our well known Washington correspondent Mr C H Claudy to tap this reservoir for us and his articles will feature our pages, we hope for a long time to come We direct the attention of our readers to his first communication which appears in this Issue

Sublime Heroism in the Navy

HE United States Navy is held in high esteem by the American people and its personnel officers and men alike, have an assured position in our regard and affection Although these sentiments have en greatly stimulated by the fine record of the navy during the present war, they are not local or ophemera Pride in the navy and affection for its officers and gallant lads are as old as the nation itself. They had their birth with the birth of the Republic and ships and men alike have served to build up on all the seven seas that tradition of patriotism courage heroism and chivalry, which is the navy a most cherished posses

They had no traditions nothing up to which they had to live said an officer of the victorious fleet in explaining the wholesale surrender of the German fleet

Naval tradition-how swiftly the men and ships who made it leap to our minds! Paul Jones and the homme Richard Farragut and the Hartford Dewey and the 'Olympia Rodman and the New York, with all the men who, on destroyer, scout and transport faced that modern terror the pirate submarine in the bitter cold and furious weather of European waters

But it is not of heroisin in battle on the high seas that we wish to speak just now but of heroism of another kind and place We wish to offer our tribute to the brave lads of the navy who as mentioned in the adjoining column deliberately courted death in the quiet of a sick ward filled with victims of that dread disease influensa

The psychologists tell us that heroism is a complex of many impulses and emotions particularly when it is displayed in the heat of battle. Lack of these adds its stimulus of pride batred anger desire for fame and reward patriotism and self sacrifice. There is also the inspiration of comradeship and the stimulating leadership of the officers One or several or all of those combine to carry the men forward to heroic deeds

But when those sailor lads in Boston and San Francisco entered the sick ward bent over their stricken comrades and deliberately breathed in the pestilential exhalations they went over the top with just the simple motives of patriotism and self-sacrifice. Unarmed and naked they faced a fee that had slain its citizens of their own country

They knew perfectly well what they were doing for aught they knew the great world outside of that quiet ward would never learn of their supreme sacrifice No mapiring bugle note called to duty no onlooking army spurred to action, no decoration was flashed before their eyes—no reward save that which comes when a man's own consusance whispers to him. Well done own conscience whispers to him, Well done (greater love bath no man than this that a man lay

down his life for his friends '

We suggest that the Navy Department make knows the names of these hundred satiormen who volunteered for this hazard of death. Thus will our naval tradition be enriched and their names and their sacrifice be honorably perpetuated

The Influenza Mystery Deepens

OME time ago in commenting on the spread of epidemie influenza, we spoke of the disease as a disease of mystery ' That this is even more true today is indicated by experiments just made public by the United States Public Health Service

It may be recalled that medical scientists are by no means agreed as to the nature of influence influence bacillus discovered by Pfeiffer in 1802 has, it is true been found associated in a large proportion of the cases during the present world wide epidemie, but the best opinion looks upon this bacterium as more probably a secondary invader, and holds that the true causative micro-organism has not yet been isolate

Some months ago, Nicolle a well-known French bacteriologist reported the results of a series of experiments which indicated that the virus of influence was ultra-microscopie and able to pass through filters of unglased porcelain. This announcement appeared the more credible since the investigations by Foster, an American army surgeon, had already shown that common colds are caused by a filterable virus

Quite unexpectedly, however Rosensu of Harvard, made public the results of experiments which he believed indicated that the virus of influensa was not filterable He introduced into the nose and throat of a number of volunteers filtered secretions from active cases of infuenza and failed to reproduce the disease Careful examination of the protocols of Rosenau's experiments showed however, that he had failed to test the infec-

tivity of the unfiltered secretion

It was to remedy these defects in the investigations that a second series of experiments was made, this time in cooperation with the Hygienic laboratory of the United States Public Health Service In this investigation, which was carried on both in Boston and San Francisc over one hundred men of the naval training station volunteered to submit themselves to experimental in oculations By means of sprays and swabs filtered and unfiltered secretions from active cases of influence were transferred to the nose and throat of the volunteers In addition to this pure cultures of Pfeiffer bacilli were similarly introduced, for, after all it was still important to know whether this could produce typical influensa. much as possible, a group of volunteers brought into a ward in which were active cases of influenza lean sch of ten bod patients, conversed a few minutes and allowed the patients to sough into their faces

And the result?-in not a single instance was influensa thus produced in any of the volunteers!

It is of course, possible, that in influence the virus is present in the masal secretions for only a limited period This is the case for example, in measles In yellov too, we know that the virus exists in the blood for only a few days so that search made before and after that sriod invariably yields negative results

By analogy there is still every reason to believe that influence is most commonly spread by droplet infection, succese and spit This, too, as the view of Surgeon-General Blue who warns against a musinterpretation of the experiments just cited. More than ever, therefore influenza is to be regarded as the disease of mystery

Round Pegs and Square Heles

ERHAPS in no field of science has the war stimulated such sudden and such notable advances as in that of the psychologist. He has had unprecedented opportunity to observe the behavior of men under conditions of stress and he has been called upon to make tests, and perforce to devise machine and methods of test, on a stale never before contem-plated He has proved his technique to himself and to others he now stands on a level of achievement and recog-nition impossible of attainment is years of normal activity

Four weeks ago we thus summarized the year's develop-ment in this science which has so heavy been transferred from the reaim of the inexact to the entegory of the smoot we then supposed that, having graduated into the class with the exact scientist, the psychologist would still, here to go a long way toward overcoming popular is before he could show definite evidence of his accept as a practical scientist, an engineer But any expect tion to the contrary notwithstanding, the payob has just made a real advance toward that very goal is announced that Columbia College will, in Septem abandon the old system of entrance examinations. substitute psychological tests to determine the stu mental capacity

As in the past the candidate for admission will be required to exhibit his school record Instead of pro-ceeding on the theory that this certificate is open to suspiction, however, the College will accept it without more ado as evidence that the student has eatis academic prerequisites for college work. Having thus graded his learning, it will then proceed to grade his intelligence by means of tests of substantially the sort adopted by the Army These tests will be interpreted in connection with the candidate s history, to determine whether or not he can profitably be asked to continue his schooling Dean Hawkes hits the nail on the head when he says "We expect these tests to show us whether it will be worth our while to try to educate the student, and whether it will be worth his while to have us try

This is a radical departure, but, we believe, not too radical a one Set examinations are not of themselves objectionable, if the student has not sufficient contro over what he has learned to meet the examination with success, he has not sufficient control to meet practical situations where he is called upon to use his acquired knowledge For this reason, we have little sympathy for the student who complains that his peculiar temperament prevents him from doing himself justice in an exam-ination. If he can't command his learning when he need it, what possible sense is there in his acquiring it

It is, therefore not at all on the ground of any objetion to set examinations, as such, that we hasten to endorse the proposed change. It is rather on the ground that in passing his preparatory school courses the student has already subjected himself to a more or less severe examination, and has emerged from it with succ has always impressed us as a tremendous waste of effort to examine him seriatim every winter and spring for three or four years, and then do it all over again m one wild week preceding his entrance to college

It will of course be urged that the percentage of students who come up with good school records and fail to handle the entrance examinations is sufficiently large to show that this repetition is necessary We believe, on the contrary, that the preparatory schools are lax in their examinations and in their awarding of certificates, because the certificate of the school that John Smith has passed his plane geometry really means nothing save that he has attended the course in plane go It has this restricted meaning because the collrefuse to allow it any other The school can, therefore, afford to thrust upon the college the responsibility of telling the student that his school work has been badly If, however, the school certificate were accepted at its face value, it would be well understood that an undue number of cases where students from a particular school turn out to have inadequate preparation would result in refusal longer to recognise certificates from that school. Then the school would have to shoulder its own responsibilities, and the result would be better for the ol, better for the student, better for the college

The innovation which Columbia has adopted will further result in more intelligent selection of the stu body Under the old system, anybody who can be crammed with enough facts to get by the unaminers gets into college, he may not stay long, but he gets in The fact is that while a certain specific preparation is neces-sary before a student can attend college profitably—just as we must build the anchorage before we can erect bridge-it is by no means the most important factor.

What should constitute the determining factor in admitting students to college is precisely those qualities of general intelligence and maturity of mind wh ence or absence is revealed by the psychological test. This test is, therefore, more significant than the old one. Columbia has done well in bringing should this innovation.

Naval and Military

Skircean Inich vs. Eighteen-Inich Ounn.—The renewal of the 18-insk game from the British cruser "Furious," because their dicharge stressed the ship a structure too heavily, suggests that our 16-inch fiftysciller gam is about the limit of weight and power for nevel ordnance. Our gun weighs 128 tons and its shell \$1,000 pounds, the shell of the 16-inch gun much have weighed come 3,000 pounds and 6-inch gun much have

The Submersizes is Blind and Slow—La spite of the fast that the Ridds have some estam-drawn, 2,700-ton submarines, capable of a surface speed of from 23 to 58 knots, the submarine, as a reapon of war is too slow and too blind when it as submerged to be considered a sections weapon or naval warfare. When it can see alsotsteadly, to a distance of 10 to 15 miles while it is an assummarged on deeply as to be invisable to the aircout and when it can steem 20 knots submerged, it will dominate the navy mixture mixture of the submitted of the submitted

Tank Used for Hauling Barges.—The French have recently made an interesting demonstration of the evaluability of the tank for water transportation. On a recent occasion, one of these former angines of destruction was put to work on the Marna Canal near Eperacy by the Ministry of Public Works The tank haulied a large sourcy of barges at a speed of nearly two miles an hour, which is double the speed that could have been ands with the same load hauled by horses or rules

How the Australians Bagged an 11-inch Gun— Describing how a German 11-inch rullroad gun was outpured by Qesenshand infantry, Figielt has the following to my "The Queenshand infantry may a train appearedly trying to get off one line and onto another to escape. In the ometer of the train was a great shoeted object. A British plane dropped a bomb near the engine which apparently damaged it, for a large cloud of steam was trained the crew, who were afterward expirated, were terribly seakled. The plane then dropped a bomb on the stall of the train, which blew up. An Australian segineer got up steam, unbooked the tail of the train, and shunted the run through to our lines

U. S. Shipping Board Teats Riccric Welding of Ships.—After schamsively investigating electrical welding, the Riccricial Welding Committee of the United States Shipping Board, Emergency Freet Corporation, is owell satisfied as to the practicability of this process, that it formally urged that a 0,300-deadweight-ton ship be built by selectrical welding. Thus recommendation has not as yet been approved because of the general sentiment among the body of experts that a smaller ship should be first constructed. Meanwhile, there is about to be built for demonstration purposes at the yard of the Federal Shipbuilding Corporation at Kearney N. J. a 45-doot electrically welded muchaip section of a 9,000 ton ship. The methods of assembling and welding to be used on this section are due to A. J. Mason, Consulting Engineer for the United States Shipping Board and member of the Electric Welding Commuties

The "Easie" Boats -The Ford 'Eagle" boats of which we are hearing so much just now were designed for anti-submarine service-work for which we have always considered them to be too small Lane officers would have preferred a larger craft and we believe that if our navel constructors had had their way and been left satirely free in the matter, they also would have designed a larger boat with better see keeping qualities. How fee Mr Ford had to do with the design we do not know, but we do know that speed of construction was a ing consideration. Hence the framing and the seal lines of the ships were drawn so as to reduce og and general working to a minimum mit the boats have straight wedge bows, with practically none of that flare which characterises all modern war vassels Consequently, they would be in trouble driving into a head sea or running before a following sea, which inter seas they would be very difficult to steer they the scantization of kay more of these boats wild be shaudoned, or the design should be modified to give them better ass-keeping qualities Testimony we receively given before the House Naval Committee that 113 maps reclaimed, that 7 have been practically som-planted and that 8 are searly for commensor. The con-lineate fage 45 we more have been cascaded. The con-tents given are fulfill and sengites wer \$375.00; they have sent \$400.00.

Science

Negroes in the United States—The last annual report of the Director of the Consus announces the completion in readiness for publication at an early date of a compilation, in one volume of all the census statistics pertaining to the neger near that have been collected in this country from 1790 to the present time. This report includes, in addition to data from the decennial reports, annual mortality statistics relating to negroes for the vears 1900 to 1915.

Barthquakes in 1918—The official report of the Georgetown University Someological Station Washington, D C, shows that during the year 1918 there were recorded on the seamongraph 88 earthquakes. From dispatches received the location of 37 quakes of importance was ascertained. Of these three were disastrous the first occurring in Guatemials the second in China and the third in Porto Rivo No disturbance of any consequence is tabulated as having taken place in the United States.

E46 Substitutes —The U S Bureau of Chematry has recently turned its attention to the numerous accelled "egg substitutes now on the market concerning some of which extravagant claums are made on their labels, as to their food value and their ability to serve the purpose of eggs in baking and cooking Analyses show that many of these substitutes consuit seemitally of a mixture of stareh and baking powder colored yellow with a socil-tar dre A few contium caseun which is an ingredient of milk The food value of such preparations, says the Bureau is far inferior to that of eggs and experiments show that the substitutes do not have the effect of eggs in cooking Artion has already been taken under the Food and Drugs Act to prosecute the manufacturers of some of these preparations of some of these preparations.

The Mountainners of Tennessee -Some Interesting studies have been made by Dr Ales Hrdlicks, of the onian Institution on the Tennessee mountained specially as exemplified by 150 men called for examinan in the first army draft. His work commencing at Bristol, Tenn., extended to Mountain City and farther on into the hills. His studies do not confirm the idea that these mountaineers represent a separate type of Americans Among them are found some aples of fine physique while others are of relatively feeble mental powers or nervous stability perhaps due to the hereditary effects of alcoholms or other inherited defects. There are all grades of moun-" and no line of demarkation separates them from the people in the lower lands who are mostly of similar derivation. Many mountaineer families are remarkable for their size. One man of 83 was the father of 21 children, ranging down to three or four years old The draft, says Dr Hrdicka should prove a God-send to many of the young men many of whom are illiterate, and whose worst enemies are isolation, 'moonshine" whiskey, and in many cases poor heredity

Vital Statistics in the United States -From year to year the SCIENTIFIC AMERICAN has recorded the steady, though far too slow approach which this country has been making to a place in the ranks of those nations which possess such a system of collecting vital statistics as may reasonably be demanded of a civilized people According to the recent annual report of the Census Bureau for the past fiscal year, the registration area for death statistics has now grown until it embraces 28 states the territory of Hawaii, the District of Columbia and 42 cities in non-registration states. Thus it contain approximately 73 per cent of the total population of the country. The most recent additions were the stat of country e and the territory of Hawaii admitted for 1 117, and the State of Oregon admitted for 1918 The inclusion of Hawaii extended for the first time beyond the limits of continental United States the area for which the Census Bureau annually collects and publishes mortality statistics No state territory or city is admitted until a test has been made to prove that the deaths occurring therein are properly recorded under state law or municipal ordinance, and that the regustration is at least 90 per cent complete The Federal collection of birth statistics began in 1915 with a registration area comprising ten states and the District of Columbia and comprising ten states and the binting to Continuous and about 31 per cent of the total population. Ten states have since been added, and the area contains about 53 per cent of the country's total population.

Electricity

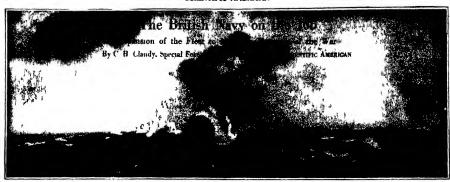

Fixation of Nitrogen in Japan —According to the Jondon Blectrican the Japanese Government has desided to establish a laboratory for the study of questions relating to the fixation of atmosphere nitrogen Hitherto 20 000 000 years worth of ammons for fertilisars has been imported and it is hoped to make Japan independent of foreign supplies

Again The Renewable Fuse Flug.—The latest renewable fuse plug to be placed on the market appears to be about as ample as could be desired. It consists of only three parts A one-pince porcelain body with outside thread to fit the cutout a fuse strip of the desired angusty and a muse disk cover. The fuse strip can be inserted in a few moments. It is pushed through a slot alongside the modified of the bettom pulled up made and bent through a slot near the top and over to the outside, being fastened in a little pocket at the bottom of the thread the other end is bent over the bottom button, thus forming the end contact then pushed through another slot on the opposite side of the button and bent over inside to prevent the end falling out when the fuse blows. After the mics is replaced, the plug can be put back ready for use.

Solution of Flood Lighting Problems -The socalled flood lighting which has found many special applications in the United States will no doubt become more familiar throughout the world in the no distant future From a recent article in the General Electric Review it is evident that such methods are already becoming standardised and with the data available for any particular projector it is easy to determine the resultant illumination on an object at a given distance or the number of projectors necessary to cover a given We notice that the illumination considered sarily varies according to the surface of the building or other object illuminated and its surroundings no doubt is quite natural as one would expect a higher illumination to be necessary in order to make an object stand out in a brightly lit thoroughfare than would be peeded if it stands alone amidst dark surrounding

Preumatic ' Fishing Device for Conduit Work -In conduit work where the wires are to be enclosed in metal pipe the joining of the conduit by no means terminates the task of the electrician mains the task of passing or fishing the wires through the conduit which is by no means a simple one where there are many elbows. New methods have done much to simplify this task. One of the most recent is a pneumatic fishing device consisting of a hand pump, pressure tank flexible air hose reel for cord, and a The traveler consists of a small shaft carrying three light disks which form a more or less perfect piston with the conduit walls as the eylinder When air ressure is applied the traveler is pneumatically impelled along the conduit whether it is straight or curved, and around all manner of bends and elbows A cord is pulled after the traveler When the traveler has reached the other end of the conduct the string can be employed for pulling the wires through

Maintenance of Accumulators in War Time .-In Elektrotechnik und Maschinenbau an account is recently given of some special difficulties leading to the breakdown of some cells in a buffer battery installed in the generating station of an Austrian street-railway The trouble was due to faulty maintenance, which is attributed to war conditions. Several cells were known to be in a bad way but could not receive immediate attention and ultimately one of them up shooting out long flames which could only be put out after the battery had been disconnected. The breakdown which was repeated shortly afterward on another cell was due to the destruction of the plates which fell away from the upper lead frame The level of the acid had sunk below this line of fraction the whole supply of 600 volts being thus interrupted an arc ensued and volatilised the lead. The author quotes this example as a warning to take care to keep the upper edge of battery plates well ammersed in the electrolyte. If the story had not appeared in a technical contemporary should have said that such circumstances could not have arisen in a civilised country But that raises other reflections adds The Blectracion, in abstracting the forecoung account

The battle cruiser ' New Zealand driving into a head sea

Tight the Britch Newy had two by man teaks to perform in the war and performed them by the wind performed them by the wind present of them by the wind generally admitted. It was to real Britain stack as possessing the greatest fleet in histry first to aweep the German flag from the seas and econd to so blockade the German I impre that its supplies from w thout had to come by tortious ways and secret mithode rather

than by ships.

Latt or in as the war developed grew two other problems in the solving of which the allied naves bore a
somewhat larger share though by in means ever as large
as that played by the British Navy. These were the
submar is meaner and the safe convoy of both troops
animals and munitions and especially of troops and
munitions across 3000 miles forceas from America.

How well the job was done every one known Just how it was done five know and less will tell. It is repthly held at the British Admirally that while perhaps little harm could be done by revealing all the story of the grantic tasks performed by the British ships it may well be the part of wadom to wait for a full revealation with the consulted traces in caller a feet and and the beautiful the story of the grantic tasks performed to consult the and and the beautiful the second could be story to the story of th

grants tasks performed by the British ships it may well be the part of wadom to wait for a full Perelation until the concluded passes is finally a fact and not a hope. There are however certain things which there is no longer any objection to spreading broadcast and these or some of them were laid before me to use for the benefit of the Scientific Augustians and its readers the ma ority of whom will unquestionably be interested in knowing just how big the Grand I leet is and what was its growth during the ways.

ourning ute was:

On August 3d 1914 the personnel of the British Navy
was 140 000 mm. Four years later the total man power
force was 400 000. These men began the war with a
displacement tennage segregating 2 500 000 tens and
after four years sailed in bottoms which segregated the
enormous amount of 0 500 000 displacement tons a figure
which it is simpost impossible to grasp. It includes of
course all the sunkings abjust and mail craft acquired
at the sunkings abjust and those such as for
the sunkings of t

But the building record has been without a parallel and perhaps nothing (unless it be the figures of accompishment other than battle results) can give a clearer itea of how single-mindedly Great Britain lived up to her n at often heard maxim. Win the war!

Battle-cruisers passing to their meerings after a wintry patrol

Since the beginning of the war Great Britam has completed eleven battleships, three battle-cruisers three cruisers 40 light cruisers, 300 destroyers 130 submarines 39 monators 60 pairel boats 600 motor boats and 300 mins remeals both aveopers and layers. At the start of the war sha persessed some four hundred vessels and when the armustice was sugged over five thousand flaw the Britash flag including some seventeen hundred travelers converted from a hundred peaceful sea pursuits to submarns hunters partel beats not guard vessels etc. It is one thing however to increase ships and personnel and quite another to have them function periodly in a short time. It is here according to the vision of officers high in the Britash Admiratly that tradition played a very vital role. As one of them phrased it 'Do you suppose that if occursoly had so the propose that if occursoly had so the propose that in Cornsoly had so the propose that the standard of the propose that the propose the propose that the propose the propose that the propose the propose that the propose the propose that the propose that the propose that the

Whatever the reason however the sudden expansion of alige and men by nearly three times was not accompanied by any diministion of dissipline or effectiveness as far as the results are concerned. Reference is not made here to the Jutland battle nor the anti-submarine campaign nor the sweeping of German radien from the sea but to the vitally important labors of transportation, accomplished in the face of the submarine mease with a percentage of loss most surprisingly small. All in all more than twenty-one million allied troops

All in all more than twenty-one million allied troops have been transported by so of these 4.39 have been clost at sea or 02 per cent of the total carried. To upport these me and gre them the wherewithal with which to fight 86.000.000 tons of stores for the Britan Naval and Milliary forces and 24.000.000 tons not asserted to the state of 110.000.000 tons not not considered to the state of 110.000.000 tons not not make the process of the state of 110.000.000 tons not considered to the state of 110.000.000 tons not make the process of the state of 110.000.000 tons not store for the state of 110.000 tons not store for the state of 110.000 tons not store for the state of 110.000 tons not store for the state of 110.0000 tons not store for the state of 110.000 tons not store for the state of 110.0000 tons not

by convoy
The convoys began in March 1917 when the necessity
to keep off the submarne rader was alarmingly apparent. Singe that date there have been 75 929 salings
convoyed with a loss of 417 ships or 024 per cent of the
asilings. To make this a little more read than day figures
succeeded in doing it may be mentioned that an 1917

The Grand Floot on patrol in the North Sea At times the line was sixty miles in length

Great Britain bought most of the Argan-tine wheat erop. But the Argantine as far away and there was no pray, not even "Luntanise" with women and children or hospital ships with wounded men which the German raider liked better than a wheat ship. England was to be strafed by slow starvation and the means were submarise hunters of food ships. Yet the British Navy did its work so well that of the 30° convoyed vessels whon aggregated 1408 000 duplacement tons carrying this wheat one vessel was lottle

1 400 000 curpiacement tons carrying this wheat one vessel was lost! Of course, not all convoy work was as successful Statistics are as yet somewhat unrelated and fragmentary because Great Britain has by no means gotten well started in the vast work of compilation started in the vast work or compilation necessary to publish complete statistics of the war and her part in it. But there are some facts available. For instance the British merchant steamships of more than ement to and from ports in the United Kingdom only, were most generally convoyed During the year from September, 1917 to the same month

from September, 1917 to the mann month its an average of almost 29 per cent of such ships were convoyed. Of these which were not onvoyed an average of 44 dep reent were lost. Of the convoyed vessels 70 per cent were lost 0f the convoyed vessels 70 per cent were lost before or after convoy while of those in the convoy an average of 58 per cent were lost. In other Sigures 220 ships convoyed, lost 5½ ships approximately, while 60 ships unconvoyed lost titnes and half ships approximately in the solution of the convoyed ship in the some of submanne monace was over centle times which it was to a convoyed ship with the British Nary on the job Navy on the job

There is a great deal of talk about the freedom of the seas and no one knows ust what it means We know the sea has been supthing but free during the period when Germany ran amuck and used her submannes without regard to law agreement or humanity. But what free-dom of the seas there was enough to put an American army in France which turned the scales and to maintain which turned the scales and to maintain food communications so that three nations could fight without starving what freedom of the seas there was came very largely because Great Britain had at the beginning the ships and the men and the ability and the will to build and trans-form others to equip and train the needed personnel and to use her mighty weapon with the bull dog tenacity, the quiet courage and the simple direct effectiveness always characteristic of the performance of her navy and her merchant marine

An Airplane with Wings of Metal

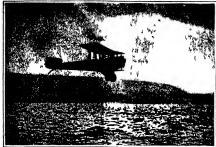

MORE than once it has been suggested that the arplane should follow a more substantial con struction. Why keep to delinate wood, guy wires and fabric? And always the answer has been that, weight for weight, the materials in general use cannot be

the materian in general use cannot pe improved upon

But the Germans have again gone into new glide and set saide all ongmeering prejudices. This time it is in the form of the Junker armoved machine which is the first real all-metal airplane

The Junker armored machine seems to have been designed for attacking trenches its fuselage m of the typical German design to fussings in of the typical German design and carries armor plate along its flat sides. The slightly curved top is of aluminum. The bottom of the body is formed of three flat surfaces, the middle one of which is horizontal, hot other two alongs so at to connect the edges of the horizontal bottom with those of the vertical sides. The engine, a 230 horse-power Bens, is also protected by armor pighting which is detachable so as to allow access to the eagine. The spracing is finished off just behind the gumer's pockpit, where it is constituted except the fussioning by a curved armor pists shaped to fours the gumer's body rest.

The wings, however, see of greatest sterest. The internal construction of the ings is in the form of duralumin tubes

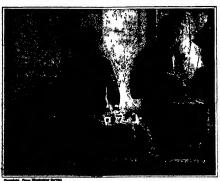

Land type British torpedoplane in the act of launching its 2 000-nound torpedo

crossing diagonally and connecting the tubular spars which latter are far greater in in ber than is ordinarily found in an airplane wing. In the Junker there may be said to be six spars if () nte the top 111 tt

tubes lying vertically above on another as one spar In section the planes of the Junker are enormously deep the maximum thickness of the top plane being about 16 inches The chord of this wing is a little over 8 feet. while the chord of the bottor plane is appr ximately 5

Junker armored airplane, whose wings are covered with thin corrugated aluminum

Wireless telephone apparatus which connect airships with ground stations

feet. The wings are covered with light corrugated shiminum shouts

From the fact that no trace was found of interplan strut fittings it would appear that these members have been dispensed with in the Junker The Junker is made in monoplane and biplane designs The one shown is probably the monoplane type

The Torpedoplane of Reality

EVIR since R ar Almiral Brailey A plane ba k in July 1912 this form of naval part of naval ner Bit it has remained fr the British and the Germans to give the tlet at a tial try it and this they did turing the last years of the great war. The tori diplane is n thing more than

an airplane or staj lanc arranged to carry one or more torped ses which it can launch at surface targets from a distance of a veral hundred yards to ensure accuracy of aim
The British have constructed torpedo planes in which a single torpedo is carried tween the floats or wheels depending on

whether the craft is a seaplane or land machines The Germans have constructed similar machines In some instances the torpedoplanes have had single engines while in others they have been of the

werful twin-engine model

British naval officers sank two ships during 1916 by means of torpedoplan The Germans rotalisted by sinking the British steamship Gena by means of one of their torpedoplanes However the war ended before either side could try out the tor; edoplane on an extensive scale hence the efficiency of this naval weapon is still a matter for conjecture It is under stood that a single torpedo weighing about 2 000 pounds is generally carried More torpedoes mean a larger machine which in turn means a botter mark for the enemy gunners Hence the single-torpedo type seems the best for the purpose

Wireless Telephony Between Airships and Ground Stations

TWO slender wires not exceeding 75 feet in length a cabinet no larger than the familiar household breadbox, but mounting various knobs instruments and bulbs on its front panel a square flat box mounting divers instruments not indicate on its top panel a diminutive motor generator set which could readily be carried about by a boy a collection of tiny dry cells embedded in wax so as to form compact units of many volts each—that in brief is the apparatus

which makes possible the carrying on of conversation between mirships and ground stations Such an in stallation was recently placed on the roof of the Equitable Building in New York city during a W S S celebration and the public was treated to a demonstration of wire-

less telephony between a large Navy dirigible and the station just mentioned

The Navy system of wireless telephony for airships is practically the same as that of the Army indeed the same as that of the Army indeed the same manu facturers a ipply their instruments to both services. I'we types of transmitters were employed in the New York demonstration. both of practically the same size design and general construction. The wireless waves in each case are generated by so called vacuum bulbs of the photron type three such bulbs being used with each set In one set two photrons are employed for generating the waves while the third is used in the modulating circuit which impresses the voice on the waves In the other set one photron is employed for generating the waves while two photrons are employed as modulators

The photo as are made in the form of electric lan ps with spiral filaments a cythin rical plut and a tiny grid 'the filament operates on a 12 volt storage battery A 22-volt dry battery is required in getting the builb to oscillate or produ waves This task is then taken over by a diminutive motor generator which converts low voltage current into 1 500-volt current for the grid of the

(Continued on page 104)

Battery Versus Magneto on the Airplane

A Sequel to "The True Story of the Liberty Motor"

THE further Germany's foes went in the war against Till further Germany's fore went in the war against lier the more ovidence they unearthed as to the thor sughaese of her ji sparation. I hit tale of industries thrown into confuse it is, the withdrawal of some German-made or German-motifed essential as a familiar one. In the manufacture of the internal combustion enguse the strategic point held by the fum lay in the gigntion system a condition had been reasted unded which magnetos—especially magnetos suitable for aviation— were so largely made in (ermany that the opening of

thought the left the Allis in a serious predicament.

Toward meeting this situation America made a material contribution. This was made possible partly by our vigorous motor truck divelopment which had kept our magneto industry in good shape but above all by a new typ of American magneto just coming into its own at this critical period. The rotary pole magneto, described in our issue of January 11th, had not reached its present estate in 1914 but it existed and gave survice. One of the steps that the Allies took to meet their emergency was the placing in this country of orders for this magneto First and last, hundreds of thousands were shipped and their part in Allied control of the air

anything but small

Another measure which the Allied engineers must have considered was the alternative of battery ignition. But the opinion prevailed until the appearance of the Liberty Motor that a battery was out of place on a The I berty however, is a success and this it could not be if its ignition were an absolute 'bust Its performance accordingly means something to the ignition engineer, but what? It might mean that the battery is to supplant the magneto it might mean that the two are to be on an equal footing it might mean that the battery is a sufficient emergency substitute for a magneto it might mean that a man who is determin to run a p ane on battery ignition can get away with it. The only way to decide just what it does mean is by a general hearing of the case of battery vs magneto

The battery system consists of two fundamental parts -battery and generator the rest of the outfit is the mechanism of timing distribution and control bines the magneto itself is a generator without a battery, the obvious question is Why the battery. We may let its advocates speak first and tell us the reason, as

Concerning Safety Factors

A plane differs from a truck or a car, the pilot can't get out and tinker with his machine can t draw to one side and await expert aid—he must complete his day a work without irregularity of operation, or not at all And if irregularity comes if puts him in peril where on the ground it morely constitutes an inconvenience. So we must give the aviator every factor of safety in terms of ignition, this involves two means of creating the vital spark. Then if one staff fails he can lean on the vital spark the other

The battery advocate says he has met this requirement Into battery advocate says no mas met this requirement. He says that if the battery fails the generator goes on firing, and if the generator fails the battery goes on firing 80 he daims he has provided two separate sources of current. The magneto man can do as much only by mounting two magnetos and this gives the battery a

big advantage in weight e magnete mun disputes all this. He is not satisfied that the generator will go on indefinitely with the battery out of commission. In the absence of the regulator run from the battery and from the battery alone he wants to know what is to prevent the generator from going up and up and up until it burns out But he will not press this point for he has a more serious one which the battery man admits. With the battery out the generator at best will fire only so long as the engine runs continuously after it once stops the gonerator can never start it. We shall return to this On the other hand even the battery man can't claim

that the battery will go on indefinitely after the generator fails His best argument here is that the battery will fire for three hours. It will last for three hours because its capacity is nine ampere-hous and the ignition but the asgreto man save current is three amneres current is surce amperes. But the agencie man says that it will obviously go down below sparking voltage before the three hours are up. But the existence of a period for the battery, rather than its exact length is the critical point. The magneto man wants to know whether the pilot is supposed to go on with his work for that period, relying upon the single source of spark which is definitely going to quit without warning or whether he is supposed to drop all business and rush for home the minute his generator goes out Either alternative seems an embarrassing one

The Parable of the Sock

A certain laborer banked half his week a carnings in an old sock, and at the end of the month paid the rent out of the sock. He argued that he had thus two sources of funds if he lost the sock he still had hu job, while if he lost the to the sock he still had hu job, while if he lost the pob he had the sock. One day he did lose hus job, whereupon he discovered that he could get out of the sock exactly what he had put into it from his pay. envelope, and not a cent mor

The magneto man says that the battery booster is in just this position. He says that the battery charsed just this position. He says that the battery charged from the generator, is not a source of current at all, like the sock, it is depository, from which we can get back only what we have sailed down in If it be suggested that the battery is a source to the extent of its initial charge, the magneto man will point out that to offset this initial sum in the sock, there is a hole in the latter through which 30 pcr cuit of all the electrical the latter through which 30 per cent of all the electrical funds deposited in it leak away. He will close out this side of the case by asserting that if the battery man wants two independent sources of current either of which will spark indefinitely after the other quits and neither of which is in any way affected by the quitting of the other—if he wants to compete with the magneto, in other words—he must mount an entire duplicate outfit—battery, generator, and all Then he loses his

outil—battery, generator, and as besseted advantage in weight. The magneto man now brang forward has claim of positive advantage, which is, a better spark. The magneto spark increases in intensity with the speed of the motor, but otherwise as remarkably constants. The battery spark is admitted to fall off in intensity at high battery spark is admitted to fall off in intensity at high spark of the distribution, the magneto make rays it is variable and the addition, the magneto make rays it is variable and the addition, the magneto make rays it is variable and the spark of the distribution of the spark of the s battery spark is admitted to fall off in intensity at high speed, in addition, the magneto maker says it avanable on its own grounds, going down, now and again, to a point that implies a massed applosion. This indictiment the battery man of course indeparantly denses. The magneto man search stath its battery oscillographs were made from a stook Laberty ignition set, under field conditions, and he says that the oan gat a variable spark out of the battery by fair means, the aviator can de so, to So much for noutive arruptment, what of negatives

out of the battery by far means, the aviator can do so, too 80 much for postive arguments, what of negative ones? When the battery man is asked to critiques the magneto, he says it has too many moving parts. The magneto man agrees; but he challenges the bettery to make a better showing. If the battery could be installed without the generator, it would constitute an improvement inder this count, but on an aurisane it amprovement under unis count, but on an airplane it can to so it fails to make good its own point. Before the invention of the rotary pole, it might have been argued that the magneto was limited to eight cylinders and that the battery therefore had an advantage in flexibility. this can no longer be admitted

"Trouble, Trouble, Nothing but Trouble!"

When we ask the magnete man to stop boosting his when we ask the magneto man to stop boosung ms outht and to knock the battery system he replies that the latter convicts itself. In the army training school at the magneto factory, the bulk of the lectures and the bulk of the hierature placed in the student's hands is devoted to explaining to him the construction and the operating principles of the magneto. In the battery school the matter is quite otherwise, a preponderance of the work of his co arse here is given over to making of the work of his course here is given over to making him acquainted with the 57 varieties of trouble he may expect to meet, and the ways for avoiding and over-coming them. In at least one instance, he is told Don't touch it, send for an expert!

The magneto man figures that this state of affairs is natural enough The battery system comprises a generator and a battery and a couple of distributors and a regulator and an ammeter He says that acand a regulator and a numeter its says that ac-cordingly it may be expected to display all the weak-nesses found in any of these units, together with the special weaknesses inherent in a complicated electro-mechanical system composed of numerous elements of diverse structure and operation claborately intercon-

I thus the bastery consusts of a vessel containing figuid, which must remain instead which travelling on a phase which must remain on a phase some passes of the passes about it must have been passed. Before it goes about it must have been passed before its goes about it must have been passed on just the right speeding parvilly by a procedure which the magneto man refuses to believe in possible outside table laboratory. After it goes about it must be kept from sulfating. Fully charged, there is no prospect of its freeding, but laid discharged, it freesses between 8° and freeding, but laid discharged, it freesses between 8° and 30° below sero, Fahrenheit

The magneto man lays stress upon the number of wires and connections in the battery system. He points out that a battery expert has to be an expert in half a dosen lines. He considers that the great number of places is which to look for trouble makes it a master of more time to put the battery system in order and keep it so he passes to his climax

The magneto-operated plane is sta ted by an independent, hand-operated magneto. Whenever compression exists in a single cylinder that little coffee-mill after with starts the engine. The battery-oquipped plane after will start the engine. The battery-oquipped plane in the starts of the start will start the engine. The battery-oquipped plane in the start that the generator will first the engine as long as the engine runs continuously. But the minute the engine stops, the generator without the batte y will never start it again, under any terms whatever. This is what our battery friend was getting at when he stated, conservatively enough, that "the engine will continue to run indefinitely until stopped, when difficulty will result in starting." (The itsides are ours.)

When this meahne comes down, the pitch is expected to throw off his ignition switch. But being human, sooner or later he us going to forget this. The battery

sooner or later he is going to forget this. The battery will then go on discharging until it is as dead as Julius Caesar, and that plane will stay right there until it Caesar, and that plane will stay right there until to gets a fresh battery II this happens at home, it is merely an inconvenience though perhaps far from a minor one But when the battery and the engine die at the same time over hostile territory, add one plane d one aviator to the list of missing in action aviator flying on his generator alone, with his battery out of commission knows with complete certainty that

out of commission knows with complete certainty that anything that stops his engine stops his plane for good 80 much for the case of battery vs magneto in aerial work. We say nothing for or against the use of the battery elsewhere But items which on the ground naturely essewhere But items which on the ground constitute merily offsets to the advantages—mostly of sconomy—gained by using a battery, become, in the magneto man's mind, conclusive arguments against that the use of the battery in the air. For planes, be insiste that the precedent laid down in favor of the magneto is a just one

is a just one
Prior to the appearance of the Liberty, no ranking
plates had ever mounted battery upition, all records
are held by magneto-equipped planes, right down to the
altitude record made in the home of the battery, the
other day, by a Hippano-Suna plane, with rotary-pole
magneto Why, then, is the battery ignition found on
that theserves. the Liberty?

What About the Liberty?

The designers of this engine have rpoken in these columns. The True Story of the Liberty Motor, which appeared in our issue of June 1st last, was compiled after close contact with the mon responsible for the entire development. We quoted these men to the effect that, while the original commercial plans called for battery ignition they had shared the general opinion for battery ignition they had shared the general opinion with regard to the desirability of the magneto, and had made every effort to use it, that it had failed, and that when, in this dilemma, they turned to the battery, it had done (the job. The first indictment brought to justify this action is that, in the Liberty tests, "
possibly to the vibration of the engine at high aper magnets of the magneto showed fatigue, and gradually lost their magnetic property"

makers were not content with directing attention to the discrepancy between this and the classes that 'tests of the sagms showed that there was no noticeable volvation with the cylinders set at this numeral angle. They didn't believe that any amount of ribration would knock the purce out of their magnets, and to prove it, they installed a stock rotary-pole magnets. to prove it, they matalled a stock rotary-pole magnete on a Hispan-chiuse sight, and ran it continuously for 55 hours. The engineer of thus test any that he didn't make that test on a Liberty because he had then no stock magnete that would fire the Liberty, but that if the make that would fire the Liberty, but that if the fired that would fire the Liberty, but that if the magnete that would fire the Liberty in the end of the run the magnets were found to have less that of the liberty designent are repaired to the liberty designent are right in their allapstime it constitutes a slap, not at the magneto, but rather at the engine that rathles to self me access.

When the Liberty experimental work was being done. (Continued on year 104)

The German Losses at Jutland

To the Editor of the Scientific American

There are a number of interesting naval items more
or less clouded in mystery that I have been looking to of item counted in mystory than a series does not not any your columns to clear up since the surrender of part of the German fleet and the admission of German defeat at Jutland by the German navel officer, Captain Persus The latter's confession bears out Admiral Jellicoe a report The latter's confession bears out Admiral Jollicos a report of the battle concerning heavy Garman losses that could not be positively confirmed at the time ewing to the mist, smoke and dashness But with the most powerful part of the Garman Navy in a British harbor and a British aguadors guarding the balance at Kirel and Wilhelmshawes, the identity of the "severe losses" of the High Seas Fleet still remains unknown. We were led to believe that those losses in capital shape in addition to the lives that these losses in capital shape in addition to the still the still remains unknown. We were led to believe that these losses in capital shape in addition to the battle-cruiser, supposed to be the "You der Tann," and the dead of the still remains unknown that the dead of the still remains and not a new "crasts" surrendered the other day along with four other battle-cruisers. There remains the and not a new creace surrounded the Greek way along with four other battle-crusser. There remains the probability that the battle-cruser "seen to sink" was the Greek "Salamis" building in Germany in 1914 and the Greek "Salamia" building in Germany in 1914 and taken over "Be is approximately of the same ionnages as the "You der Tann" and probably similar in appear-ance and the Germans took advantage of the uncertainty surrounding her, in concealing her loss by stating that only five battle-crussers took part in the fight and then in answer to detains of the British as to battle-crusser losses, snawer to claims of the British as to battle-cruss! losses, by proving the crustence of all but the "Lutsow" which loss thay subsequently admitted, (e., Sedditt," Moltke," "Borfunger" and "Von der Tann." The Britash believed that the "Hindenburg took part also, but this would brung the German battle-crusser strength to seven, while the British only reported a total of ax Thewfore, if the "Hindenburg" was completed in time to take part in the fight, which I doubt (and this ought to be easy to ascertain now), then the "Stalanis," or whatever German name she bore—did not, but if abd dot she would undoubtedly have been surrendered on November 21st as the British demanded all the German battle-cruisers. It seems that probably he was the vassel sunk in action, but the world awaste confirmation Nove no accurate account of the Battle of Jutland can

vessel suck in action, but the world awaite confirmation.

Now no accurate account of the Battle of Juthand can
be written until these matters are cleared up and when
we come to German dreadnought losses, there is further
confusion.

It is known that all the German ships of this confusion. It is known that all the German ships of this class that were completed at the time, 17, were in the fight, i.e., four "Koenigs five "Kaners' four 'Olden burgs' and four 'Nassaus'. The British claim the destruction of two But all five 'Kaners' and three of the four 'Koenigs' surrendered, and the other 'Koenigs' was interned at Kiel, not being in condition to put to see (all of them the original ships and not "ersatt"). Therefore, the loss must have been sustained by the other squadron of cight 'Nassaus' and "Oldenburgs. The press dispatches coming from Germany at various times the content of the custement of the custemer of the custeme press dispatches coming from Germany at various times together with photographs have ductosed the existence of most if not all of these eight vessels, the most recent dispatches grups accounts of the revolutionary movement among the sailors mentioning a number of them by mane. It has also been stated that their surrounder was not demanded, because it was known that their arms ment had been removed to the Western Front and much continued to the sailors of the sailors together with photographs have disclosed the existence

se, but to a layman at least unless definite statements of proof of German losses in capital ships other than the old Pommern the 'Lutsow' and (gwing Britam the benefit of the doubt) the balamm's are forthcoming, credit must be given in all fairness to the much desposed Light Seas Fleet ao ignobly given up for balancing the above loss (together with four light cruisers, nine destroyers and one U-locat) against the destruction of three British battle-cruisers. three old the contract of the British battle-cruisers three old the battle-cruisers three old the contract in the destruction of the British battle-cruisers three old the state of the British battle-cruisers three old the state of the British battle-cruisers three old the state of the British battle-cruisers three old three british battle-cruisers and the British battle-cruisers are also better the British battle-cruisers three old three british battle-cruisers t (giving Britain the benefit of the doubt) the

[We have already stated in these columns that in the beence of an official report or the subject the statement made by the Germans after the Jutland battle would seem to be correct, so far as their losses are concerned Captain is seems to imply that it e losses were greater, and he ought to know The point is well taken regarding the "Salamie" The "Audacio is was mined early in the war and sank She is reported to have been raised, but toe doubt at -Enrron l

A Wanton Waste

To the Editor of the SCIENTIFIC AMERICAN According to the daily pipers of December 14th a collection of 2,625 dangerous weapons taken from criminals and others during 1018 and valued at \$30 000 was thrown into the occan by the New York police department. The item caught my eye rather forcibly and I thought it ought to be brought to your attention in your capacity as moulders of public opinion In these days of high pressure conservation it seems almost incredible that any state officials should be guilty of throwing away \$30,000 worth of material, which according to the clipping, did not contain any explosives other such dangerous substance. It is obvious that the stock of the pistois, revolvers etc. must have been of high quality metal which could easily be reclaimed and put to more logitimate usc.

Concrete Roads for Heavy Traffic To the Editor of the SCIENTIFIC AMERICAN

Some Motor Truck I conomics "Some Motor Truck I conomics appearing in the Scientific American for December 28th 1918 well Scientific American for December 28th 1918 well describes the madequacy of our present highway system for motor truck traffic. The failure of our roads under this new means of transport has been very general. Yet there are exceptions to this general unpreparedness of our highways which should not be forgotten—exceptions which are due to the foresight and energy of progressive communities

Notable among these are the extensive concrete road systems of Wayne County Mich Milwaukee County Wis, Huron County, Ohio Maron County Ind and Vermilion County, Ill. In all of these counts, concrete roads have stood up under in it rims, that limiting whether it be trains of government trucks supplies for manu facturers, loads of coal, farm produce or miscellaneous

The statement, "When yer the big army trucks have The statement, "Wherever it is big army trucks have run constantly, there have r ads gine to pieces is true in most cases, but not when it require was over will constructed, hard surface it yet mints. From Detroit, long government truck trains have left for the coast over Wayne County roads and the reads have been fully adequate Local motor car traffic over Wayne. County a 150 miles of concrete roads is an irm us and by 1u v 1st 1918, there had been licensed 9 988 motor truck and commercial vehicles and 57 633 pressing r carp. 1-affic on Woodward Avenue on June 10th 1917 in might less than 14 hours amounted to 11 000 motor driven vel cles

than 14 hours amounted to 11 000 motor driven vel cless Similar, though perhaps its of that frailip assess over the other concrete systems so that while ac quartarrough routes are yet to be constructed a number of communities are already prepared for the motor truck

Finger Print Classification

To the Editor of the SCIENTIFIC AMERICAN

To those persons, who for any reason, find it trouble-some to use the old or improved Henry System of Finger Print Identification I suggest the use of the Hollman Notation as adapted to all purposes and being

Holiman rutasens as maps of the control of the Holiman Nutation each ascepted specific style of Registry print is pormanently assigned a numeral as follows Whorls (1) ulnars (loops) (2), central

pocket loops (3), radials (loops) (4), lateral pocket loops (5), tented arches (6), twinned loops (7) arches (8), accidentals (9) The cipher (0) is used wherever a finger or fingers are missing or has the finger print ridges permanently mutilisated otherwise the dash () is used until superseded

It will be noticed that the even numerals are assigned to loops-arches and the odd numerals to the whorlscomposites In making an index number or fraction there are five places which give a number in the tens of thousands the left-hand or highest place being assigned to the thumb, next (to the right) the first finger and so on to the units place which is assigned to the fourth or little finger. The right hand is the denominator of the filing fraction—the left hand is the numerator

Thus the Henry Classification 1 sA 13 would read

42 222 13 in the Hollman Notation. The first two numerals of each number are the style of each thumb and index finger respectively then the second third and fourth fingers 13 is the number of ridges in the loop of the right fourth finger

The Hollman Notation is self-indexing and interpret-

Into Hollman recurring and in serpresenting and its scope seems to be unlimited. Determination of styles (types) is in accordance with the principles laid down in The Finger Print Instructor by Frederick Kuhne (Munn & Co., 1916)

F H ROBINSON Brooklyn, N Y

An Open Letter from the Secretary of Labor

To the Business Men of the United States

Every public discussion shows how sincerely and eagerly the business men of the country are seeking a labor policy that will enable them to take advantage of the many commercial opportunities awaiting them Business men are coming to recognise generally that efficiency in production and consideration of the interests of workers are meeparable

It is natural that these men turn to the Government for leadership in dealing with a problem that is national in scope and interest. The tendency of government is toward closer relations with industry. The research work to secure the data and determine the standards as the bash of business organization can best be performed by a disinterested governmental agency, able to gather the experiences of all and to reach conclusions based upon

The Department of Agriculture, the Department of Commerce, the Department of Interior, have constantly been developing more practical service to the interests they serve I here is an analogous service the Depart ment of Labor can perform Just as the Bureau of Foreign and Domestic Commerce furnishes information esources transportation and trade of foreign coun tnes the Bureau of Mines advises mine operators on technical problems safety and sanitation standards the Department of Agriculture furnishes farmers the scientific rmation necessary to successful production and sale of farm products there is a scientific field in which the Department of Labor can serve as consulting expert to employers and employes in industrial production field includes sanitary and safety standards, the administration of measures necessary to prevent physical dis abilities and the relations between managers and em

ployes known as simployment problems

This service is distinct from that performed by the Mediation and Conclusion branch which deals with working conditions and industrial itlations as contro issues between employers and employes Antici variant issues overed chiphytris and employes. Anticipating the intrasing importance of establishing working conditions on a secutific basis the Dipartment of Labor created the Worling Conditions Service. The work of the Service is conducted through three to work of the extree is conducted through three to ordinated divisions. Division of Industrial Hygienic and Medicine Division of Indoor Administration and Division of Safety Engineering.

The Division of Industrial Hygieni

develop standards of samtation and medical practice in industries I he personnel of this Division is detailed from the United States Public Health Service

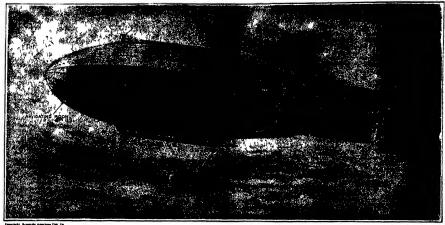

The Division of Labor Administration will advise employers as to employment as stems and labor management policies, and assist in putting into operation stand

their portion, and phrising and phrisis and policies.

The Division of bafety I agencering will develop standards and practices for accident prevention, and advise employers as to safety methods best adapted to

The Department of Labor offers business practical service at a time when its need is manifest assistance is available to owners and managers of indus trial establishments in working out labor policies and

Airship Versus Airplane

Salient Features of the Two Types of Aircraft With Regard to Their Applicability to Passenger Transport By Ladislas d'Orey, M.S.A.E.

Now that the quantity production of non-inflammable lifting gashelium-has eliminated the most serious defect of airships i c the truly disproportionate fire risk their method of sustensition involved there cannot be the slightest doubt but that the major if not all problems of aerial transport will in the near future be solved by the airship, and not by the airplane

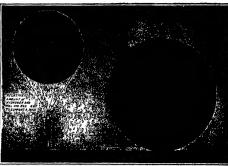

Such a statement is likely to rouse the ire of airplane manufacturers, it is never-theless based on irrefutable facts, as will be seen bereafter

Taking into consideration only essential factors the respective merits and defects of the airship and the airplane for commercial purposes may be reduced to the following terms

In the airship sustentation is achieved by means distinct from propulsion whoreas in the airplant forward motion generated by the propelling at paratus is the necessary condition of lift Threfore while an airship can stay about regardless contents of the propelling and the propelling and the propelling areas and about the propelling and the propelling areas are also as the propelling and the propelling and the propelling as the propelling and the propelling as the propelling and the propelling as the propelling of engine stoppage (accidental or voluntary) a failure of the airplane s power plant necessitates an immediate

power plant necessitates an immediate descent in gliding flight. This feature furnishes one of the most serious objections to the use of most serious objections to the use of the airplane as a passonger carrier for a forced landing is not very pleasant to visualize when occurring on vast stretches of wooded or mountainous country or the Northern Atlantic in rud winter for example In this connection it is interesting to recall that in a paper read last year before the Royal Aeronautical Society the suggestion was made to establish along future lanes of serial transport a chain of landing grounds not r than ten miles apart so sirpisnes in distress may always find level areas within the range of their gliding angle That such a scheme, entailing as

[N last week's issue of the Scientific American we announced that helium could now be produced on a commercial scale cheaply enough and in sufficient quantity to replace hydrogen in balloons and airships Because helium is a non combustible gas its use will result in material changes in the design of dirigibles The engines can actually be placed inside the shell of the balloon bringing the propellers on the axis of head resistance and this resistence can be cut down materially by preserving a perfect stream-line design, unbroken by suspended cars and a tangle of stays A possible helium airship of the future is illustrated herewith We also show by illustration the lift of helium as compared with hydrogen and the present cost of helium as compared with its cost before the war A new future has been opened to the airship and its advantages as compared with those of the airplans are here discussed -EDITOR

Lift of helium and hydrogen compared, also cost of helium now and before the war

may well be inquired an enormous penditure should have been seriously sug gested by an enthusiastic advocate of com cial aviation who is by the way one of mercial aviation who is by the way one of the largest British arplane manufacturers, is highly significant because it emphasizes the fundamental defect of all hasvier than-air craft that is, the insufficient security afforded by dynamic sustentiation. It is true that load-carrying sirphanes have been developed during the war in which the risk of a forced landing is some what reduced because the motive averageting.

what reduced because the motive apparatus what reduced because the motive apparatus is split up into several power units. But even so the risk is only lessened and not eliminated, for it is materially impossible that a twin-engined airplane for instance carry when flying on one engine more than one-half its indicated full load—unless, of

ocourse, the machine is so designed as to carry its full load on one engine, with another engine kept idle for emer-gencies The latter solution—quite regardless of mechanical difficulties regardless of medianical difficulties is conductive to such a waste of carry-ing capacity that it cannot be seriously entertained for a moment

It has been variously suggested that could the airplane be fitted with lifting screws whereby it would be able to hover like an airship, the able to hover like an aurhip, the principal objection, on grounds of insufficient security, to its uses as a passenger carrier would be eliminated. This is however a fallacy because— without discussing the feasibility of such a scheme—the lifting screws would just like the propellers, be subject to stoppage through engine trouble Now it may be argued that acronautic engines will eventually atacronautic engines will eventually at-tain a degree of reliability that will virtually eliminate the risk of a forced landing While this assumption seems justified there is nevertheless one specific case in which even engine reliability cannot prevail against the inherent defect of the airplane; mely its mability to hover This case is the necessary

which will constitute perhaps the most serious problem affecting the successful operation of commercial flying services serrous processing flying services if a log bank covers the servicine, and incoming simplane will have to fly round and round until the fog clears away—or the fuel supply gives out, under the same circumstances an airship will stop its engines and hover until a landing can

sately be exected.

The superiority of the airship over the airplane in affording security to passengers under the most difficult operating conditions is thing manifest. A Zeppelin-type airship, in which floatation is secured by 20, red by 20, or more, separate gas-bags is fully com-parable as to safety to a steamer fitted with watertight compartments. Just as a steamer may spring a loak and have several watertight compartments flooded without sinking, so can a Zeppelin mainwithout sinking, so can a Zeppelin main-tain its buoyanoy even if several of its gas-bags, shenid he pierced Injury of this sort may by the way be mended in flight, because balloon fabrics can be patched like automobile trues, it follows that ariships of the rigid type have little tear of accident on this score. On the other hand it is true that atmos-

heric conditions (sudden variations of temperature, a pheete conditions (success variations of temperature, a heavy rainfall, sowetorms, etc) may cause a consider-able reduction in the lift of arriving, this feature may appear as a drawback of lighter-than-are craft, but need not cause real concern provided supply tanks, for re-charging the garb-caps in the sir, and a sufficient amount of ballast are curried on board

Raliability

Security in operation is, as has been seen, mainly a matter of sustantation reliability is one of propulsion Nation to safety, ability to reach within a reasonable time limit the place of destination is the most important requirement that must be demanded of commercial air-

Thus defined, reliability in operation depends (1) pon the trustworthiness of the propelling apparatus, ad (2) upon the maximum speed the arrship is capable

and (2) upon the maximum specu use arising a uniform of developing. Now, eague reliability can be achieved more easily Now, eague reliability can be achieved more easily on airships than on airplanes because on the former the great buoyancy permit the use of comparatively heavy engines, these may furthermore be throttled down for long stretches—when flying before the wand, for instance which reliabes them of considerable strain whereas on airplanes the engines have to be run most of the time at full nower. Another bout in favor of the arribip is at full power Another point in favor of the airship is that, owing to its independent sustentation, minor engine

tant, owing to its inapopenent sustentation, minor engine repairs can be effected in flight properties of the second section of the second section in the Jave been made by airplanes, whereas airships have not exceeded 75 m p h, from which the conclusion

may be drawn that airplane are much more independent of adverse winds than air-ships While this is true to some extent, it should be noted that the surplanes endowed with the highest speed are single, or two-seater machines carrying a useful load of but a few hundred pounds, whereas great load-carriers, such as the Handley-Page for instance, do not exceed as a rule 90 m p h The superi-ority of the commercially usable airplane over the airship is therefore not so very marked with regard to speed Furthermore, the Zeppelin Furthermore, the Zeppelin, which is the fastest type of airship in existence does not embody the hull shape most favorable to high speeds, because it was designed for quantity production, it may be assumed, that by adopting a finer streamline hull the speed sould be bettered some ten miles per hour.

Bemoving the sandbags, boards and other protection from the Vendome Column in Paris

take oruses with beavy eargics which entirely outstrp in importance anything large airplance have so far achieved A Expision of the 1917 model (60 gross lift tons, 1,200 h p, 70 m p h) could actually cross the Atlantic, earrying 100 passes agrees as h 50 pounds of baggage each and a crew of 90 at a mean speed of 50 m h, which comes to assume that the trift from Irribard Alianus, control of the control of t mail service as soon as peace as signed. These arrahips are to have a gross lift of 115 tons and a total horse-power of 2,400, they will carr; 30 tons of the provisions, etc., 45 tons of earge and mails and 100 passengers that is, the useful load will exceed 80 tons.

These figures would seem fantastic were it not a well

known fact that in airships the loading efficiency that is known fact that in ariships the loading efficiency that is the ratio of useful to grees that greatly increases with an increase in size when as in arplanes it runuins at best constant. The reason for this is that the lift of an airship increases as the volume or the rule of the an airship increases as the volume or the rule of the an airship increases as the volume or the rule of the an airship increases as the volume of the rule of the an airship increases only as the sequence, the sequence of the rule of the anti-rule of the rule of the rule of the rule of the rule of the increase on both craft in a recording to the superficient of the increase of the rule of the increase of the rule of the

hand the weight of the structure increases on both craft in proportion to the superfici area on the at such exceed. Thus, the bashing efficiency does not a stude exceed and the such as t

a craft would possess in rapid, long

In a discussion of the merits of success in a discussion of the inerts of aircraft or committeed purposes the question of confort afterded to travellers as by means negligible quite regardless of all speed in five this 11 machine in question may be 11 fert. Indeed if the air ship or the airs on a become an scorpted means of travel comparable to steamships railways etc. then the acrual aveler must be arsured of finding reason able comfort on board surcraft

(Continued on page 104)

Uncovering Paris Monuments Now That Air Raids Are Over

WITH the danger of air raids and Whili the danger of air rands and bombardment now past Paris is again displaying her art works to her appreciative visitors. Already, many of the carefully protected public monuments have been uncovered and restored to their peacetime appearance Typical of this activity is the accompanying view which

shows a group of workmen engaged in removing the sandbags cement walls and boards from the stately Vendome Column

S A. T. C. Salvage

WITH demobilization of the Army and Navy Units of the Students Army Training Corps at Stevens VY of the Students Army Training Corps at Stevens. Institute of Technology at 10boken completed there are left nearly 500 men who will go on with the regular mechanical engineering course, only about 70 having withdrawn. Ihis is regarded as an exceptional record and leaves the total college attendance close to the highest record of previous years which was 520. Even this may be surpassed by the return of men who left the course to volunteer in the early days of the war. A number of these men have a Iready applied for reinstate-

Disastrous Explosion of a Tank of Molasses

WHAT is there in molasses that would make it WHAT is there in moissees that would make it exholed particularly in winter time when the sticky syrup is proverbially alow? Two weeks ago a large tank of moissees exploded in Boston killing a dozen persons and injuring 50 more and no completely satisfactory explanation of the disaster is obtainable

astafactory explanation of the disaster is obtainable. The tank was a luge cylindrical siructure with a capacity of two million gallons. Without an instant a capacity of two million gallons. Without an instant a work burst agant. A city bulling nearby, where the employees were at lunch collapsed burying a number of victims and a fire house was crushed in by a section of the tank, killing and mjuring a number of the fremene. Wreckage was seathered in all directions while

a deluge of molasses spread over the runs and mto street, suffocating many of the injured and increasing the difficulty of rescue

The only plausible explanation of this unique disaster is based on the assumption that there was an accumulation of alcohol in the tank In order to have the molasses fluid enough to flow readily through pipes steam-heating or ils were placed in the tank and it is quite possible that there WAR somo fermentation generating a certain amount of alcohol It may be that the steam was left on too long warming the melasses sufficiently to vaporize the alcohol and this, mixing with the air at the top of the tank, resulted in the accumulation of an explosive mixture which needed but a spark to touch needed but a spara to tourn it off Possibly an attendant lowered a lantern into the tank or dropped a lighted match into it to determine how much molasses it con tamed and then-the accompanying photograph tells the rest

A group of Boy Scents that made goed on the slogan, "Every Scent to feed a soldier"

Harnessing Boy-Power

The Story of the Boy Scouts-What They Are and What They Have Done By William B. Ashley

WHAT is boy-power?
Boy-power is exuberant boy energy After the normal scalawag lots loose a requisite amount of energy on study, eats, sleeps, and trying to behave he has a whole lot of energy left over

This exuberant energy is employed by the average boy in a number of ways. He uses it to generate loud yells at sudden intervals, to move his arms and legs in games like baseball and football tag, and athletics generally, it makes catapults of his arms when snow is abundant and motors of his legs when skating is in vogue It helps him roll cigarettes kick a tin can along the sidewalk, fight, ring doorbells, run to fires, stone cats and dogs And it sometimes is employed in shoveling the snow off of sidewalks, cutting wood, pushing a lawn mower around, spading a garden, running errands, and even

around, spading a garden, running (rrands, and even holding down a job after shoot hours Lxptrts state that the average boy is awake approximately 5.500 hours in the year Taking the year through 900 of these hours are spect inside the school room, 1,500 inside his hours, and 100 inside church and bundly whood libres thou church and bundly whood libres thou spect outdoors working off his coubrant therety. Then are exceptions, and the war has somewhat changed the general conditions but this malviss of a boy's conditions but this analysis of a boy s time is accurate enough for the purpose in hand

What is the product of the use that the boy puts his exulterant energy to, the d,000 hours in a year? As there are around 8,000 000 boys in the United Stated whose ages run from 12 to 18 this question is

important
In a large degree it is muscle health can be included a good constitu-tion for the years shead. These are valuable assets. But suppose this extion for the years aneso loss are valuable assets But suppose this ex-uberant energy, this boy-power, can be harnessed so that it will produce other benefits to the boy himself and very specific benefits to the community and the state without robbing the boy of muscle or health, or of any of the worth-while fun he has while directing the use of his own exuberant energy? Suppose also that in this process the boy who formerly would have arrived at the threshold of business life 15 per cent prepared (let us

say), should by this process arrive there 55 per cent pre-pared 20 per cent more efficient at the very start of his business life

his bunnes life
Hartford, Conn, was to have its annual elean-up
The Chamber of Commerce called upon the 350 Boy
Srouts of the city to assets At une in the morning

the indispensable work these loyal boys dai? The Boy
Srout Movement, as an efform and ideal nethod of
harnesum boy-power, is the subject of this strated
The catalog above included "urnuning to fires" From
time immemorial the boy has been an infernal nuisance

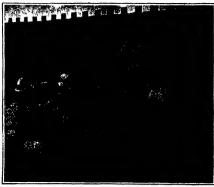

to the firemen. But in various localities Boy Scouts are being organized as fire patrols. They have a system of quiet mobilisation. Special automobiles carry them with their equipment of fire rakes, axes, water bags, and so forth, to any point where they may be needed. The law gives them the right to commandeer plows, teams, and most between the ages of eighteen and fifty-five years. The scouts are authorized to tear down fearors, settle lands, cut trees or do anything reasonable in the discharge of their fire duties. This is an examples of how becomes from the boy a. boy-power formerly employed in making the boy a nussance, harnessed, can make him an asset to himself

How did this idea of organising boys for civic service come about?

The germ of it is found in the daily good turn, which every Boy Scout is expected to do for someone without

Boy Scout is expected to do for someone without no form in a practical expression of the ability of a boy to do things for himself "and others" One great object of the Boy Scout Movement is to help boys develop ability to do things for themselves and others

evelop shills to do things for themselves and others. The good turn is either spontaneous, or the result of deliberate search for an opportunity It must be practical It oan be an individual act, or performed by a group of secute 1 for example, a number of secute on a car one night discovered as an old lady who had lost her "bearings" (the secure of the control of

Some more Scout work that looks toward improved food supply

SCIENTIFIC AMERICAN

established public drinking pinces, a grack larger number where they are esponsible for the rausing and lowering of the flag on public buildings, and a still larger number in which secuts are resible for adding to the attractives of their home esties.

Perhaps this process might better have been called "storing up boy-power" A boy's muscle grows by the use of it, and his ability to do things increases by precision It's the play spirit, the team-work spirit, the idea of doing something out of the ordinary, that keeps the Boy ordinary, that keeps the Boy And all the time he is storing

work apits, the idea of doing something out of the ordinary, that keeps the Boy Soout at it. And all the time he is atomig up within himself a big reservor of power that will make him an invaluable clusten when he comes of sever Lot a see how this women couples the estimate and the comparison occupies the estimate the comparison of th Typical civic good turns that are duplicated gain and again An appropriate line of solion work was sasigned the scoute at police work was shaigned the scouts at Farpo, in stopping venous pranks on Hallows en night It is the common thing for spouts to be called upon to hunt lost children. And as stated, firmanship is proving one of the best means of utilising exuberant energy Great tastes, these, of manhood responsibilities that he just

The war has doubtless taught all nations the need of conservation of natural re-sources. What's that got to do with a glerious outdoor hike on Lincoln's Birthgorius duxion mine on Lancon's Birthaday? Nothing. But come to think of it, Abraham Lincoln was a rail splitter What of that? Well, doesn't that suggest splitting wood? Why not a fuel hike when every scout gots out his scout axe and gets into the woods and converts fallen timber into firewood for the needy?

And it wasn't only on Lincoln's Burthday by any means that the socute practiced that form of conservation Anti-destructiveness is an underlying principle of scouting Men who lay hold of the responsibilities of government with that idea imbedded in their natures, will never be grafters

Too much cannot be said in commendation of the method of education that makes a boy delight in doing

Boy Scents acting as sides to the Fire Department get fun and valuable training of every description

well such serious things as these. You can imagine the thrill of pride which young scouts of Abilene Texas felt when they helped the Chamber of Commerce to rete was tasy supped the channer of Commerce to promote a municipal water system and to select a site for a mechanical and agricultural college. Something has happened when a boy instead o throwing sticks and stomes up into a horse-thestnut tree and shinning up any tree along the walk that takes his fancy regardless

When boys will do this for the health and beauty of their town civic service has them for keeps

of broken branches, will laboriously make a complete census of the 14,083 trees within his city s limits tabulat consists of the 1s,005 trees within the city w 11,590 natural gas users between 10 P M and 3 A M to turn off their jets because of in accident has stored up for the days of his maniful time the power that arises only from a sense of responsibility. The climax thus far in the development of the Boy Scout Daily Good Jurn into organized civic service was the tremendous contribution of the Boy Souts to our Covernment's conduct of the war. These scouts at must be remembered are boys out of our own home. They are not phenom of our own homes. They are not phenomerical loys. They e me from all kinds of hom s of all nstronalities of every religious erect. They run from 12 to 18 and Injoins erect. Into run from 12 to 18 and 19 years of age averaging around 151/2. They are the sors of poor people and of rich people and of in between people. They are likable lads and lads who are Inny are insule inos and inos who are lard to like. They know how to behave or they are little rulhans willing to learn Just plain American loy. But the scout-ing program grips them the stern Oath and Law with its 12 points. gives them moral backbone. The program of out-door activities gives them expertness in athletics and camping and in wood lore Successive stunts in civic service tone up their sense of solidarity. The Nation is forced into a war with another nation, and from sea to sea this great brotherhood

The Heavens in February, 1919

A Few Suggestions as to the Ages of the Stars

By Professor Henry Norris Russell, Ph.D.

WE had occasion last month to speak of the extra-ordinary brilhancy of certain stars in Orion and the neighborhood. Such objects challenge the imagination in many way: -their great size, extreme ness, and the very high temperature to which they own their luminosity. But they are most impressive of all when we consider them, not from the standpoint of the present moment, but from that of their past history and

probable future docution

Estimates of the brightness of the stars, of very fair precision, were recorded by Hipparchus, more than two thousand years ago. These suffice to make it certain that the general aspect of the constellations, as regards that the general aspect of the constitutions, as regards the brightness and the position of their stars, has not changed perceptibly in these 20 centuries. Indeed, the tew doubtful cases, in which it looks at first sight as though a few stars might have changed in brightness, are more probably due to errors in the early estimates, or in the copying of the manuscripts, than to actual

changes in the sky Direct human observation makes it clear, therefore, that in the life of a star 1,000 years is but a short time. This is of course what we should expect, from our present knowledge of the great age of the Earth, and of the life which has for so long heen evolving on its surface. On general principles, we might well expect to find that the life of our solar system far exceeded in length that of this little planet of ours, and that the life of the great system of stars was again far more extended in duration than that of our own small part of it. But what evidence, direct or indirect, do we at present posse

The Geologist's Contribution

Let us begin with the age of the Earth-or, rather, of the fossiliferous strata upon or, rather, of the lossifierous strata upon it, which, as all geologists agree, give us only the latter part of the history of the evolution of living things. This is not the place to enter into details regarding the arguments which have led geologists to make rough numerical estimates of the ages of the various formations; suffice it to say that all are agreed in placing the interval when a large variety of highly organised living things already existed—at a figure which can be measured by the tens millions of years at the very least. The only question still under dehate is wheth an estimate is not too short. Certain facts regarding the accumulation of helium in minerals containing uranium—which produces helium by a very slow radio-active proces—indicate that the age of

active process—indicate that the age of the older sedimentary rocks is a thousand million years or more. If we say roughly that the time during which life has existed on the earth is probably at least a hundred million years, and perhaps a thousand million, we shall be not far from expressing

the state of scientific opinion.

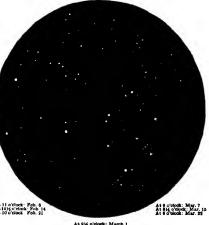

Now it is morally certain that, during all this enormous interval, the Sun has never been, even for a few years, very much hotter or colder than it is now. If its radiation of heat had been but half as great as at present, the whole surface of the Earth would have been ice-bound If the Sun had been three or four times as hot and bright as it is now, the oceans, rivers and rain would all liave been nearly if not quite at the boiling point. Either of these catastrophes would have put an end to the orderly development of life, and neither is consistent with the ical evidence. Indeed, a range of solar radiation from two-thirds to twice its present intensity seems to be about the utmost that can be admitted, and this corresponds to a change of hardly more than one magnitude in brightness, while the differences in brightness among the visible stars of the sidereal system amount to fully wenty magnitudes. It looks, therefore, as though not merely 2,000 years, but the whole of geological time, were but a short interval in the history of the Sun.

The Origin of the Stare

Further argument in favor of this view is found in the well known planetesimal hypothesis of Chamberlin and Moulton—according to which the solar system originated

by the eruption of hot masses of material from the Sun by the cruption of hot masses of material from the Stu-under the influence of the attraction of some other star which passed so close to it as barely to miss intiting it. On this hypothesis, which is supported by many lines of reasoning, the orbits of the planets wore originally of considerable eccentricity, and have attained their present nearly circular form by the action of the resis-tance due to the swarm of small particles diffused about the Stun. Mr. Jeffreys, an English astronomer, has recently scaleducted that, upon plausible sammptions, tary orbits in this fashie required to round up the plane-tary orbits in this fashie or the study of the study to the study of the study of the study of the study of the thousand million weats. This firs in were well with the they order in Linkshots among he sometaing like three thousand million years. This fits in very well with the longost estimates of geological time; but it also indicates that the sun was a "going concern" 3,000,000,000 years ago, and must therefore, be older than this by a wide

If the ages of the stars are of at all this order of mag-nitude, what hope have we that the slightest change in the condition of any one of them can be detected in our

NIGHT SKY: FEBRUARY AND MARCH

ephemeral lives? Little indeed, one might answer; but the problem is really not quite so bad as that. Recent researches—largely by Eddington and the present writer—make it probable that a star start size life as a huge body of highly ranfied and relatively cool As it contracts it becomes hotter and hotter, until at last it gets so dense at the center that it can no longer at last it gets so dense at the center that it can no ionger contract freely. Then its tagge-sture has attained a maximum, and it begins to cool off, and finally, after the lapse of sges, goes out. The Sun appears to be in early middle age—well past the maximum of temperature, but with still a long life of moderate scivity before it. But win suin a long life or moderate activity octors it. But there are many stars—such as Arcturus and Antarea— which present the evidences of youth. They have not yet rison to their greatest temporature, but are already very bright, because they are of such large diameter. Such stars must live their lives at a very much faster rate than the staid old Sun, and the rate at which they are shrinking should be rapid indeed. Even so, it would be hopeless to attempt to detect its effects, except in one

What the Figures Say

These are the Cepheid variables—stars of great bright-ness, and evidently at an early evolutionary stage—which probably one their variation to periodic vibrations of some sort affecting the main mass of the star. Now if this is true, the period of the vibrations should depend

upon the density of the star. For an increase in density of 2 per cent, the period should shorten by 1 per cent Some of these stars have been observed carefully for Some of these stars have been observed caractury for more than a century, and in one case at least—the typical star Delta Cephei—there is evidence that the period of varietion, which is rather more than five days, is actually growing shorter at the rate of one-twentisch of a second per year; that is, hy one nin-millionth part of itself every year. This indicates that it would take the a second per year; that is, by one nin-minionic part or itself every year. This indicates that it would take the star about forty-five thousand years to increase in donaity by one per cent, and 3,000,000 years to double its density. To pass from one to another of the stages of temperature which are represented by the Harward star like these, something like a teofold increase of density, which would call for some ten million years.

This estimate, which is due to Eddington, is of great interest as the first piece of direct evidence, derived

interest as the first piece of direct evidence, derived from the study of the stars themselves, and bearing on

from the study of the stars themselves, and pearing on this great problem of their ages. It is admittedly very rough at present; but when more such stars have been studied, and if their periods are found likewise to be shortening, it may be possible to get a very fair low. it may be possible to get a very fair ides of how fast a giant star lives through its early stages.

the control of the condition of a red star. To go from the condition of a red star like Antares or Betelguese to that of a very white one like those in the head of Scorplo or the belt of Crion involves passing over five successive steps, on the Harvard scale of the magnitudes just referred to. This would probably take more than fitty million years, for the changes would go on more slowly as the maximum temperature was approached. The later stages of a star's life, while it is cooling off, must last a star's life, while it is cooling off, must last heat per year, and there is a huge store of heat necessarily start of the comments of the control of the comments of the control of the comments of the control of the comments of t surface before the star ceases shining. From such evidence as we now poss

therefore, it would seem that such great stars as those of Orion's belt have already en shining for many millions of years— erhaps for a hundred millions or more while their future duration as light gi before they finally cool off to the point of extinction is likely to run into the thousands of millions of years.

The Heavens

The finest region of the sky is now in the The finest region of the sky is now in the southwest, where Orion hangs resplendent, guarded by Taurus on the right and Canis Major on the left, with Canis Minor, Gamini and Auriga above. Jupiter, which is in Gemini, and at our hour of observation ways high in the sky, adds to the brilliancy of the scene.

The most conspicuous constellation in the eastern sky The most conspicuous constellation in the eastern sky is Leo, which ske gains by the presence of a planet—in this case Saturn. Hydra rears far up from the south-seatern horizon, while Virgo and Bootes are rining in the east. The Great Bear is high in the northeast, Draos and Uras Minor are east of north, with Cambogies and Capheus in the north and northwest. Perseus, Andromeda and Arise—the last two low in the northwest—complete the tale of the prominent constellation.

The Planets

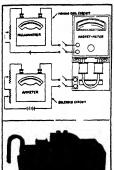

Mercury is a morning star until the 23d, and an evening

Mercury is a morning star until the 22d, and an eventing star after that date, but is so far south and so near the Sun that he is practically invisible all through the month. Venus is an evening star, and is now drawing out from the twillight and coming farther north, so that she is getting to be a compisious solpied. At the beginning of the month she sets at 6.25 P. M., but at its close she remain in sight until 7.40. She is exclusily about three times as bright as Jupitor, but will hardly look so, being much lower in the sky and on a brighter background. Telescopically the shows a small and sincet dreular disk, 11 seconds of arc in diameter.

Mars too, is an evening star and is in the neighborhood Mark coo, is an evening our and is in the neight-whose of Venus, but is only about one one-hundredth as bright. Even so, he much outshines any fixed star in the neighborhood, which is rather a dull region.

The Current Supplement

THE valuable paper on The Rôle of Selection in Eschwiston in the current assue of the SCIENTIPIC AMBRICAN SUP-PLEMENT No 2248 for February 1st 1919 deals with some of the widely divergent deals with some of the windsy divergent views held by investigators of organic evolution and the discussion will be of great interest to students of this important subject Food problems promise to be of vital significance to the greater part of the inhabitants of the world for a long time to come and it behooves everyone to devate more attention to them than has ever before more attention to them than has ever server been considered necessary. In this con-nection the study of new kinds of food materials is of great importance with a vew to hightening the demand for the limited number of foods that most of us have considered essential The world contains many materials that are now but slightly utilised or only locally which could easily be made to add to our supplies and diversify our rather narrow bill of fare to general advantage An article in this issue of the Supplement on The Palate of the Civilized World deals with this subject and describes a number of new foods almost unknown in this country and several of them are shown in accompanying illustrations It is of unusual value and interest to everyone An hieror Magnetic Alternating Current Rectifier gives very ings that will enable any amateur mech to make this useful mere of electrical anparatus The Production of Copper gives a brief account of how this indispensable is reduced from its ores and in accompanied by a number of excellent photographs Other articles of value in this issue include Electrical Welding in Shipbuilding A Wax Medium Process for Permanent Coloring of Photographe, Rems-tance of Ships Undamped Currents in Super-Conductors and The Constitution of the Earth & Intersor

Wireless Telephony Between Airshins and Ground Stations

(Continued from page 95)

pliotron As for the action of the pliotros in converting the direct current into high frequency undamped waves space does not permit of a lengthy explanation

An ordinary transmitter is amploye in connection with the sending set just described Ranges of 25 or 30 miles are readily obtained between airships and ground stations for greater ranges the transmitting set can be used to send out undamped wireless telegraph signals, by means of the regular telegraph key The receiving of the telephone messages is receiving of the telephone messages is effected by means of a compact receiving set which also employs vacuum bulbs for detecting and amplifying the inter-cepted waves. Instead of the usual head cepted waves Instead of the usual head receivers a loud-speaking telephone can be used so that the messages can be clearly heard throughout a large room.

The transmitting apparatus used by the Navy is of the most rugged character, to withstand rough handling and the intense vibration aboard airplanes and dirigibles slike The photrons are protected against vibration by ingenious systems of spring suspension or by soft rubber pads.

Battery Versus Magneto on the Airplane

(Continued from page 98)

magneto custed that would fire all the cylinders at the rregular angle after he had shown how it was to be deen all the cylinders at the rregular angle after he had shown how it was to be deen and the cylinders at the regular angle after he had shown how it was to be deen commercial purposes the simble is superior and the cylinders at the regular angle after he had shown how it was to be deen commercial purposes the simble is superior and the cylinders and the cylinders and the cylinders are the same always. All suggisted like the post the creprimenters or old to for the moment was to make their parts may be removed and replaced by the condition of the condition of the cylinders and the cylinders are the conditions and the cylinders are the conditions and the cylinders are the conditions and the cylinders are the cylinders and the cylinders are the cylinders and the cylinders are consideration of the cylinders are consideration of the cylinders are consideration and the cylinders are consideration and the cylinders are considerated as the cylinders are considerated as the cylinders are cylinders and consideration and considerati

like rotary pole engineers had built a support of the control of t code that an armsture magneto could not be made to fire the Laberty, so assuming that the retary pole was ignored, the use of the word impossible can be explained. But it can never be justified in 1917 the rotary-pole was no freak or novely, vit was on a firmer basis than when the Alles began at use in 1915. There could be no excuse for not considering it or in con-mission of the country of the country of the flexibility made (seashbe its adaptation to any motor in the world

any motor in the world

The magneto makers feel that in the The magneto makers feal that in the matter of Liberty ignition they have been lynched. They feel they were given no chance to show that the magneto could be made to fire the Liberty and that on the basis of the adoption of the battery a departure that must excite universal comment—the impression has been created that something must be wrong with the magneto. This of course is not the case

The Status of the Marrate

The only thing that the Liberty proves The only thing that the Liberty proves at that a plane can be fired by a battery Magneto makers would have conceded this they will never admit that there is any sold reason for wanting to fire a plane with a battery. Had the aircraft mtuation with a battery! Had the aircraft statation been no desperate that the three weeks data involved in adding for a modeled and involved in a state of the modeled and involved in a state of the battery which was all ready and worked out would have been justified. But the wholesale changes and revisions made in the motor even after construction was begun negative such a suggestion. These changes magnete makes feel, make it clear that they were not given the table of the state of the sta been so desperate that the three weeks

to be applicable is difficult to explain

The magneto is doing business at the old
stand All non-experimental planes that
do not mount the Liberty are fired by
magnetos Trucks and tanks and all the magnetos Trucks and tanks and all the other machinery of combat and mobilisa-tion and demobilisation mount magnetos uon and demobilization mount magnetos by the thousands. The rotary-pole magneto cannot be made in its own fastory, in sufficient numbers to meet the damade of the Government and of private users—although that factory has been expanded repeatedly lits makers have had to liteness ten manufacture by other disching the magneto a position, than describe the magneto a position, than describe the by that house. We need not here disket by that house. We need not here disket out he self-statewer of standardisation and

standardized equipment recently designed by this house We need not here dilate on the advantages of standardization and interchangeability they are known. But the man who undertakes the standardiza-tion of magnetos is food with the fact that different numbers of ophadra and different angles and different bissing lead to vastly angles and different bissing lead to vastly the different bissing the standardiza-tion of the standard by the standard by pole magneto set to work on the scheme for a universal magneto applicable to any searns.

mechanical difficulty, and with the simple tools provided with the suffit So iff you want to shift you want to shift you want to shift you magneto from the night-cylinder empire for which it was bought to a 16-vylinder, 45-degree, V-type engine, all you have to do as to look at the chart provided to call you what parts to remove and what ones to put in their places Having substituted the proper distributing block, grave, cam, brush, rotor and field structure, the thing is done, you put the same old magneto on is done, you put the same old magneto on the new engine and it fires it.

Airahip Versus Airpiane

(Continued from page 89)

This requirement is much easier to fulfill on airwhaps than on airplanes. Not only is the question of weight of mines impertance on airwhaps, the whole anothicecture of these craft is more adaptable to comfort than even the large airplans. It is obvious that a hull some 700 feet in length affords a splendid opportunity for fitting cabins, during rooms, lounges, etc., at such a distance from the propelling apcabina, dining rooms, folinges, etc, as such a distance from the propolling apparatus as to virtually suppress in the living quarters any nose caused by engines and absenced furthermore, and the suppression of the virtual control of virtual suppression of the suppression of the virtual control of virtual suppression of the suppression of the virtual control of virtual suppression of virtual suppression

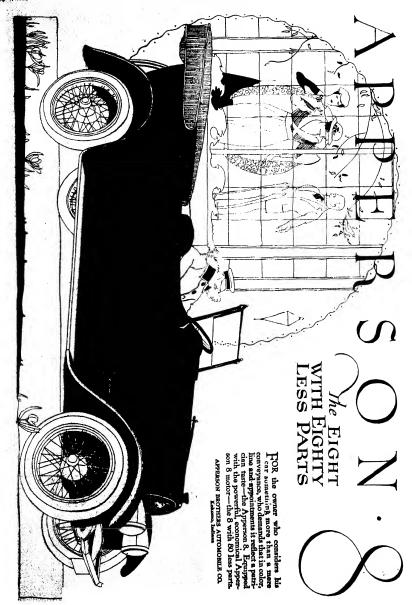

Prime Cost and Man-Pow

Prime cost of aircraft is an item difficult if not impossible, to estimate in the light of our present knowledge for lack of data based on experience Tentative figures on the prime cost of commercially adaptable sircraft have been worked out by the British Committee on Civil Aerial

Airplane (high speed) Airplane (low speed) Airplane (rigid) 18a 18a

As to the man-power required for operating airchips and airplanes, respectively figures published by the British Air Ministry indicate that airships are As Ministry indicate that atmittes me more sconomical in man-power than beavier-than-air craft These figures show that annihips employed 162 mea per bour flown, as against 5 52 for alrybanes and easplances and fare 104 heurs per more employed as against 0 40 for airplanes and scaplances.

continued from page 1811
service And yet consider what that five
per cent did for the Clovernment in the
conduct of the war!
Mr George W Edwards of the United
States Limployment Service stated in a
recent newspaper article that Boys are
everywhere leaving the classrooms for the everywhere seaving the classrooms for the factories and shops, so that school at-tendance is being seriously affected. In one large eastern state the loss for the last one large eastern state the loss for the last two years is 18 per cent from the enrell-ment to be expected in normal times. When these boys enter war industries most of them work as messengers water carriers, or helpers Because they are receiving big pay envelopes they have little inclination to enter as learners in skilled employment which offers a lower initial wage. If left which offers a lower initial wage. If left unchecked these social tendencies would unchecked these social tendencies would develop a large untrained and unakilled populatior. This would prove a serious handicap in the reconstruction period which must follow the war when the nation will need increased production and effi-ciency to restore the depleted supply of economic so

economic good.

In view of such a serious statement by such an authority, the program of the Boy Scouts of America becomes of vital importance to the nation. It is a program of preparedness in the duties of ettiesnahip Be Prepared is the slogan of the Boy Scouts. This country has never witnessed that the state of th Scouts This country has never witnessed such a spectacle as the mobilisation for national service of nearly 400,000 uniformed boys, who proved themselves prepared to perform difficult tasks efficiently It is not so much the mobilizathe period of reconstruction, that makes the program invaluable But rather, the con tribution that scout trained boys individually will make to every line of industry and in every profession, when they enter upon the duties of manhood

upon the duties of mannood Mau-leadership is the key to the success of this great movement Nearly 30,000 soutimasters and assistant sooitimasters are directing the work of these 335,000 boys 'Plan American men' these sooitimasters' Fellows of unassailable characters by the same than the same tha matters remove or unamanistic char-acter, big of heart, believers in boyhood, willing to learn the scouting program willing to give of their time and strength to a big task like this. As a matter of to a big task like the As a matter of fact, most of them get as much out of the program as the boys do, for no man ever loses his boyhood. It may have gone sound salesp, but it is made him yet And the munute he hears in his mner vonce the call of socuting, BANG! there is his boyhood out of bed and the scout uniform half on

ani on It is the simplest proposition imaginable to harness the boy-power of the nation And yot it is a far greater, more important And yot it is a far greater, more important proposition than harnessing the water power of the nation. And it is just as easy to spot the waste of boy-power in your town, as to pount to the waste of power in a racing stream. And the problem is a community problem. Harnessing the boy-power by means of the Boy Scout program, calls for community the community. power by means of the Boy social program, calls for community interest in the boys In view of what can be done, it would seem as though no man could rest content until be had done his part toward conserving, harnessing storing up the boy-power of his town for the boy himself and for his town and for his country

Extes, Incorporated, and places to all clemts a service consistent with the Ects reputation for teadership and report of results,

Farsighted Industries Will Prepare to Share in the World's Harvest

All over the world, War has sown the seed of the greatest crop in history—a glorious crop of new ideas and ideals, new inventions and discoveries, new standards of living and working.

But to secure its full fruitage the warning of recent experience must be heeded.

How England Applies the Lesson

Long before the war ended, the National Board of Trade, in England, was laying plans for the scientific direction and encouragement of industry, organization of production, greater efficiency of labor and capital, and scientific research into raw materials and manufacturing processes.

For those firms in America who are also farsighted enough to recognize that future interests demand greater industrial preparedness, the service of L. V. Estes, Incorporated, will be found particularly profitable. This service of waste elimination, cost reduction and increased production is rendered by an expertly supervised staff of over forty specialists in various branches of industrial engineering.

A Solution of the Railroad Problem

THE operation of our railroads by the Government has taught us certain lessons as to the practical value of cooperation, which should form the basis of any new system of control that may be adopted. Having said that, we wish to go on record as being opposed to complete governmental ownership and control of the railroads.

A business organisation that employs 2,000,000 mes and upon which, therefore, 10,000,000, or ten per cent of our population, is dependent for a living is a mighty factor in determining the national prosperity. When we remember that it was transportation, making over our vast network of railroads, that opened up these United States and brought them to their present high stage of development, it will be admitted that the stage of development, it will be admitted that the approximation of the properties of the properties as that of a permanent or even lengthy change from private to governmental operation, should be approached with the greatest restraint and weighed in the scales of calm business ludgment based on post experience.

The issue is between governmental ownership and operation and private ownership under reasonable direction and control by the Government; and we believe that the safe way out of the present difficulties lies in a whole-hearted adoption, by the Government and the people, of the second alternative.

It is American indistive and the competitive spirit that have made the agricultural, mechanical and industrial devolopment of the United States the wonder and admiration of the world. Therefore we should be very slow to make any change that might curtail initiative and we should set our face like adamant against any sweeping change that would kill it.

We do not know of anything that would, and does, so quickly and completely kill initiative as governmental ownership and control.

The railroads cannot have too much initiative. But past exportence has shown that they may have too much competition; and the great lesson taught by the operation of the roads under Director-General McAdoo is that the great need of the future is a reasonable and wellconsidered system of cooperation.

The roads should be returned to their owners to be operated by them, subject to a certain amount of governmental control. Thus the Interestate Commerce Commiscion policy of regulation of rates should be continued; and there is much to be said in favor of the creation of a Secretary of Transportation to consider earriers' estimates of future expenditures, including abor coats; to exercise supervision over security issues; and to fix rates designed to yield revenues sufficient for future operations and credits.

The railroads, as thus privately owned and operated, abould be permitted to colperate, where the object is to eliminate duplication of service and of facilities and to secure the most efficient use of routes, terminals and cars. Moreover, under Pederal sanction, they should be free to effect consolidations which can be shown to condusive to the mutual beacht of the public and roads

Army sirplenes at Handhurst Fleid, Long
Liland, on January 7th and the start of the return
journey to San Diego, Cal., last week. It marks the
first serious effort on the part of the Government to
gau an experience in serial overland frijing, that will
help seronauties immeasurably when it is put to commorcal and industrial uses. Primarily the flight was
undertaken to locate, photograph and aerially survey
landing fields in the more renote country of our great
Nouthwest, for the purpose of laying out possible serial
mail routes.

In its issue of December 21st, 1918, the SCINETING ARCHAEL ARCHAEL MAN ander plain the various uses to which the Government in its several departments could put the airplane, and it is encouraging to see that consideration is being given to one of the most important of those activities. If any Department of the Government is qualified to lay outs the general routing scheme, surely it is the Department of Military Acronauties with its thousands of aviators. Perhaps it can be induced to govern further and work out the problems of the Forestry Service in its Forest Fire Patrol Police, etc., for which it would be peculiarly qualified.

But without going too far afield in this discussion, we wish to record our conviction that the Oovernment should consider very seriously having the Post Office Department comploy the War Department to carry its acrial mail. Many advantages would accrus from an arrangement of this kind. First, the Post Office Department could depend upon the contractor and the contractor's ability to put a sufficiently large and experienced organisation behind the work to insure its successful accomplishment. Second, lastead of paying outside contractors for this service or maintaining an aerial force of its own, the Post Office Department would materially reduce its cost for such service, and at the same time make it possible for the Department of Military Accounties to ask for much lower appropriations from Congress for the maintenance, equipment and transing of its military photos.

The advantage of such as arrangement to our air forces is most evident. Ordinarily, to keep our military pilote is proper training and maintain their efficiency, it would be necessary that some of our largest flying fields would be necessary that some of our largest flying fields and practice of military accounties. These ould be reduced in site in the event that the Post Office Department retained their services, and they would provide many service and supply stations in various parts of the country which would add materially in the work of recruiting. Furthermore, where training was possible under actual commercial conditions, in which schedules must be maintained and discipline kept at its highest in their work than they would be in the relatively aimless flying at training schools.

Our Army has always been efficient. It built the Panama Canal when others failed. We believe it would make a success of our Aerial Mail Service!

The War's Influence on Naval Design

IT is too early as yet to predict what effect the experience gained during the war will have modifying future naval designs in a broad way. Whether it will produce radical changes in our ideal of the relative values of the various types of fighting ship, it is too early to say positively; but the present indications are that a fighting fleet will consider for many years to come, of battleships, battle-cruisers, well-armed accust ruisers, and destroyers.

Coming down to details, it is not our purpose to go elaborately into the matter just now, but rather to point out some of the leasons which apply more particularly to first-line fighting ships—that is, the dreadnought battleships and battle-oruleers.

The great increase in the length of capital ships due to the rapid development of the battle-cruiser, brings to the front the problem of atifices and longitudinal strength. During the war the British had battle-cruiser in action and on parto work, that were over 800 feet in length. The experience pained suggests that special attention must be paid to the matter of the

girder strength, or the resistance to bending str these great ships. The problem is rendered more difficult by the natural desire of the line officers who fight the ship, to have their vessel present as small a target as possible to the enemy, especially in respect to its height above the water-line. It was a matter of remark among the officers of our own fleet that when the surrendered German battleships and battle-cruise came in sight, and particularly when they came absaus they gave an impression of sitting very low in the water The battle-cruisers "Renown" and "Repulse" the same impression. This low freeboard and abs of lofty superstructures is all to the good in rendering it difficult for the enemy to score hits; but from a structural standpoint, it is all to the bad; for if we lengthen the ship without making a corresponding increase in her depth, we lose in girder depth and consequently lose enormously in girder strength-lose in fact as the square of the depth.

Closely associated with this is the tendency of late years among naval designers to fare their slape above the water line at the low, with a view to throwing the broken water away from the ship and preventing the blurring of the periscopes and gun-sight belowages. In moderate seas no harmful effect is felt from these flared hows, but when these high-speci slape are driven hard into a heavy sea, the sudden increases of the bending moments on the ship that is almost dynamic in its effect.

These conditions may be met partly by abolishing the flaring bows, thereby softening, as it were, the lifting effect of a wave, and by doubling up the plating and docks of the molded structure for a considerable distance amidships. Another method would be to carry the hull proper, one dock higher amidships.

Probably there is no more difficult task set before the naval architect than that of designing such langs vessels as our new battle-cruisers, 875 feet in langth over all and of 38 knots speed. Their draft is subject to rigid limitations, their freeboard must be kept reasonably low. Consequently, compared with a trans-Atlantic liner like the "Aquitania" or the "Leviathan," they are very shallow for their great length. Furthermore, unlike the commercial ship, their snormons loads, due to the pure of 15 or 16-inde childre with their immensely heavy barbettes, turrets, and magsaines, are concentrated at certain specified points along the ship. To this is added the anormous weight of engines and boilers us sufficient to give them their 180,000 or more horse-power.

The effect of this heavy concentration of weight and of the stresses due to the recoil of heavy guns, was shown in the case of the 32-knot ships of the "Furious" class, of great length and comparatively shoal draft, were mable to stand the recoil of the two 18-knot aguns, one forward and one aft, which were tried experimentally in the first hip of the class. The racking effect on the hull structure was such, we understand, that they were removed and 18-knot guns were substituted.

Another lesson of the war is the supreme importance of protecting the vitals of the ship against big-gun. Another lesson of the war is the supreme importance of protecting the vitals of the ship against big-gun, high-explosive shell firs. It took the satual test of hattle to show how searching is the flash of a bureting high-explosive ship of the same of a bureting high-explosive ship of the same of

Necessarily these battle-cruisers are lightly armoned compared with buttlenhips. The protective value of armor was shown by way of contrast loss, which was bestienhip of the "Guese Ellambeth" class, which was under the fire of half-a-deem German battleships at the high season of times by the held delivered as moderate ranges, she came through without with briur.

A Record of 198 Ledge was recessly established by Lieut William T. Campbell, Officer in Charge of Flying at Love Held, Dullas, Texas, with a Curties arplane, According to the Asro Chie of America, this is the Influen-cedered Lieux. Carl Batte held the previous record of 126 consecutive loops

Grossing the Highest Andes.-Lieut. Dagoberto Godoy of the Chilean army crossed the Andes at their highest point in a Bristol biplane, donated by the British deverment, on December 12th last The aviator left Santiago, Chile, and crossed the Tupungato range at an altitude of 19,700 feet, landing at Mendosa, Argentine Republic

Our Airpiane Timber.—The latest available figures dicate that more than 132,056,288 feet of first-class surplane lumber was produced in the northwest during the war, through the efforts of the spruce division of the Signal Corps These figures include production from August, 1917, when 202,264 feet were delivered, until ber, 1918, when the production reached the high

Captain René Ponck's Record -The highest official score for bringing down Hun fliers, according to Flying, goes to Captain René Fonck of the French army Befor e armistice was signed he was officially credited with 75 Boche planes, but virtually he brought down over 100 On two different occasions he brought down six machines in a few minutes Fonck was a wonderful filer and was among the first to perform the 'barrel" maneuver during an aenal battle The French Government has conferred on him nearly every decoration in its nower to mye

Airpiane Parachute Prise -- Mrs Louis Bennett, whose son, Lieut Louis Bennett of the British Air Fore tost his life while flying at the front, has offered \$500 to the Aero Club of America to be used as a prise in a contest to develop the invention of parachutes for use in escaping from airplanes which have caught on fire or got out of control The offer has been accepted, and the club has formed a committee of the following memes to organise a parachute competition Major Thomas Baldwin, A Leo Stevens, Colonel A L Fuller, Colonel Heary B Hersey, Colonel James Prentice, Lieut-Col William Thaw, Major Cushman A Rice, Congressman F H LaGuardia, Major R W Schroeder, Rear-Admiral Mark A Bristol, Commander Henry C Mustin, Commander John H Towers, Lieut Godfrey L Cabot, Lieut R A Preston, Commander P N Bellinger, Ensign Raffe Emerson, Henry Woodhouse, Frank S Lahm, and Augustus Post Although several successful types of parachutes have been employed during the great war, the relative ments of the various types have not been established, and it is for that on that the competition is to be held in the near future

The Ford of the Air -A most important developsent is the production of a low priced, most useful agdane, which is the equivalent of a Ford automobile plane, which is the equivalent of a Ford automobile This machine has been produced by the noted aeronautic engineer, Captain James V Martin In reality, Captain Martin produced this little sirplane to supply the military sed for a light fighter capable of climbing to 25,000 feet within a half hour, with two guns to fight raiding Germans, having a speed of over 100 miles an hour obtain these results he evolved new and ingenious cosain these results he evolved new and ingenious methods of construction and truesting which greatly decreased the weight and head remetance. He slice swolved a retractable chassis, which folds up like a bird folds his legs when in flight. By this one devices there is eliminated 11/100 of the total head resistance of the surplance, so that the speed is thereby increased by 11 miles an hour. The K-bar trussing reduces the head remetance through the elimination of strute and wires and permits the increase of the map and struis and whree and permits the increase of the gap and give a higher factor of selfer. The result is a very attractive little sirplane, continues Typing, equipped with 46-honespeure engine, capable of earrying two passengers et a speed of fixon 70 to 50 miles an hour. A most remarkable feature is that this sirplane will make about 32 miles we a gallon of gasoline. Having a span of early 13 feat, and weighing only 260 pounds, complete with makes, and having a landing speed of only 37 miles an hour, this plane one laid on and sicist from a diseast any country road. It is expected to call at about \$3,000

Seil Surveys in the United States —The Bureau of Soils of the U S Department of Agriculture reports that it carried out detailed soil surveys covering 38,136 square miles during the fiscal year 1918 The total area covered by such surveys up to the present time amounts to 483,961 square miles Twenty-four states and four Federal bureaus are now cooperating in the work of soil

An Official Map of Uruguay - The Geographical ownal reports that an official survey has been under-sken by the newly organized Servicio Geografico taken by Militar of Uruguay for the construction of a complete large-scale map of that republic The prime mover in this enterprise and the director of the geographic service is Colonel Silvestre Mato I he map is to be published on two scales, 1/100,000 and 1/25,000, and will not be complete for many years

An Immense Fund for Medical Research According to Science, the will of the late Captain J R De Lamar, mine owner and capitalist, leaves nearly half his \$20,000,000 estate, in equal shares to the Harvard Medical School, Johns Hopkins University and the College of Physicians and Surgeons of Columbia University for use in medical research and the dissemination of medical knowledge. The rest of the estate is left in trust to his daughter, with the provision that if she dies without usue the principal is to go to the institutions shove named

Density of Sodium Chloride Solutions -The U S Bureau of Standards has recently made a numb density determinations on samples of sea water and other sodium chloride solutions The data thus obtained, it is stated, will be of use to occanographers The Bureau has also prepared samples of sedum chloride solutions of various concentrations in connection with an investigation of the density-concentration relation and for the purpose of establishing a percentage scale for salt solutions for use in the manufacture of hydrometers to be used in the pickling industry

The Journal of Geography, heretofore published under the editorship of Prof R H Whitbeck at the University of Wisconsin, has been taken over by the American Geographical Society and will hereafter be published in New York | I his interesting journal is asued chiefly for the benefit of teachers of geography in the elementary, secondary and normal schools, and does not compete with the Geographical Review the chief organ of the American Geographical Society*and the American equivalent of the Royal Geographical Bociety's Geographical Journal

A Uniform Type for the Blind -American libraries for the blind are rejoicing over the fact that they will no longer be obliged to have books in five different kinds of raised letters in order to accommodate readers taught in different parts of the country and at different periods After many years of discussion a uniform type, to be known as 'revised Braile, has been agreed upon, and hereafter all books embossed in this country are to be in the new type "The Deserter by Richard Harding Davis, was the first book to be published in revised

Reports of Snow on Highways .- In the winter of 1917-18, the Weather Bureau in cooperation with the State Highway Commission of Pennsylvania, inaugurated a system of reports on the depth of snow at various system of reports on the unput of the system of reports on the Lincoln Highway between Harrisburg and Pittsburgh. The reports were made by the as superintendents of highways to the Weather B station at Pittsburgh, where they were bulletine station at Pittsburgh, where they were buildings as diffurnabled to the press, as well as to automobile clips and motor-track associations. The Weather Bureau also sured warnings of heavy snow for the mountain regions of Penncylvania, so that stops might be taken to keep the roads open. This winter a mular service has been started in parts of New York and New Jersey, and the system will guidably become more general, in connection with the concerted efforts that are being made by that being you commission, the Motor, Transport Servers of the Council of #stim Defense and the automorphic discissions to keep the main highway open during the susceptible of the Council of the susceptible of the control of the council of the c used as motor-truck, rural express and parcel-post

Automobile

Starting in Cold Weather On cold winter days and with the heavy gasoline now used, it is sometimes difficult to start the engine. If there is illuminating gas in the garage a quick and easy start can be made by slipping a rubber tube onto the gas jet and putting the other end into the air intake of the carburetor gasoline should not be turned on nor the carburetor looded, before the engine has warmed up

Tanks Converted into Farm Tractors -The little lightweight Renault tanks established an enviable reputation as fighting machines during the last year of the war, and now in times of peace they promise to become equally useful Already some of them have been converted into agricultural tractors by the removal of the guns and armor and a few other shight modifications, and are said to be doing excellent service on the farms of France, where labor is painfully scarce just now Another, and probably temporary use that has been found for them is towing barges on canals taking the place of horses

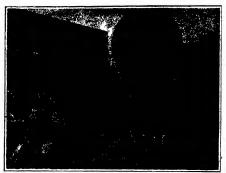

Lubricating the Car -An important direction in which we may hope to see material improvement in the near future is in the methods of lubricating automobiles It is said that on some cars there are as many as 74 points where some sort of lubricant must be ap-Many of these are entirely maccessible and there is but little doubt many of these points are never discovered by the amateur owner who cares for his own car A few years ago a car was braight over from the other side that contained a most inconous and apparently efficient lubricating system in which there were but a very few points for the application of the labricants and these were all in plain sight and casy to get at but as this car did not gain a foothold here its good features attracted but little attention Now the matter is apparently being taken up by some of our manufac turers, and it is to be hoped that a much needed wform will result

Oil vs Grease -Oil has always been a popular medium for lubricating the many wearing parts of the chassis because it was so easy to apply, and the fact is overlooked that oil will run out of a bearing just as easily as it will run in, and consequently constant attention is necessary to maintain proper lubrication Indied, this is only possible with a forced feed system which is not practical for the character of the bearings in the ordinary chassis On the other hand, while grease is not so convenient to put into the cups it can be fed under ressure, to most of the bearings thus insuring a more perfect film of lubroant in the bearing and one of a character that will survive much better under heavy loads Another good feature of grease as a lubricant is one that many an old time bicycle rider appropriated With oil in a bearing there is a pumping action that tends to suck grit into the bearing while with grease there is no such action the grease always tending to work outward, thus not only scaling and keeping grit from gaming access to the hearing, but also tendin excrete any foreign matter that might have got in by some other way

Cheap Fuel -The search for a fuel that will be cheaper than gasoline, and equally as efficient, appears to be about as clusive as that for perpetual motion and so far appears to have many of the same characteristics Tests of the latest widely heralded fuel, which appear to be only a mixture having benzol as a base, do not seem to bear out the claims made for it, and, indeed, similar mixtures have been experimented with for at least five years in England without any very practical results Undoubtedly benzol either alone or combined with other inflammable liquids that can be vaporised or properly atomised, will form a valuable addition to our fuel supplies, but there is little probability that these compounds will supplant gasoline be far little bensol has been used, as most of the supply has been required in the manufacture of explosives and its future application will depend largely on the quantities in which it will be produced more that war demands are diminishing In a sense beneal us a by-product, and as such but little attention was given to saving it before the war except in Germany, but the experiences of late have warned us the world cannot tolerate waste and it is hoped that greater quantities of this undoubtedly valuable motor

Pushball is a favorite sport at some camps

How Uncle Sam Has Created an Army of Athletes

Training Camp Activities Which Worked Wonders in Permanent Physical Betterment of the Drafted Men

Now that the great war is over to all intents and N purposes it is interesting to reflect on what it has done for the vast body of ivilians who a year and a half done for the vast by by a svalans who a year and a half ago began to flow into our in this altraity sumps. We have had in Lurope at 1 in the camps of the country approximately 400 000 me in 1 in it as a to pr due that the great majority i three will be benefitied for the rest of their bives by the course i intensive training through which they were jut. In other words Unite Sam retail in not only an arm of sol here but an army of athrees. These men are in infinitely better physical condition than they ever would have be in it a probation of the properties of the p

the most of them will make an earliest control of mains and the perhaps natural to think that with drilling and other taxing tasks of the sol hier athletics would be a superfluous commodity in camp. On the contrary it has been found that the more the mon were nursed to the vigorous use of their bodies the m re th y longed for competitive games and tests of strength. It is a known fact that men relieved from duty in the first line trenches turn instinctively to strenuous games like football to gain the healthy equilibrium ne ossary to

From experience too it has been learned that an instantaneous muscular control is owential in the success of the fighter. For two military rasons—I) develop the lighting institut and to arm that instin t with control—there has been carried out a program of stilictus unralleled in history

Uncle Sam considered athletics of the hard competitive sort that develops the fighting instinct of such importance that in the very beginning he summoned to his aid the very best talent the country possessed Some forty men among them many famous coaches wer assigned as sports directors in the several training enips Organiz-

ing and directing the athletic activities of 40 000 men and maintaining an athletic pro gram that will encourage the argest possible number of soldiers to participate regu larly in some form of ath letics during their lessure is certainly a man s size job But the reactions are remark able Football, baseball basketball soccer boxing wreetling tennis track and field athletics and all forms of winter sports were in dulged in by all the men in training Never before in the history of this country have so large a number of men engaged in athletics never before has physical welfare received such a stim-ulus Narrow-chested clerks made three base hits on the same ball teams with college athlites and lean-vuaged philosophers learned how to use their fists The book-zeoper and the street-car motorman came to grips on the football field Men

Tennis champions instructing the jackies in fine points of the game

learned to get bumped, and not to mind it of persistence was developed. Being attached to division headquarters the division at heits director was able to coordinate his plans for

inter-company and inter regimental baseball or basketinter-company and inter-regimental baseball or baskershall leagues trake events field days and the like, with the military routine of the different companies. He kept in touch with soldiers who naturally lead in athleties and attempted to stimulate the sporting eloment of their companies by the formation of a Divisional Athletic council the members of which were in turn elected by the regimental councils in the latter case such company had its roperaticatives and own athletic or make the council to the presentatives and own athletic or make the council to make the council of the counc things hum in an athletic way at any time and to stimu-late the interest of the men of all the companies in eamp

late the untrove of the men of all the companies in samp. The sports induded in the ramp curriculum such as boxing football and other personal-contact games were selected primarily to prepare the men for the struggle to come and the value of the athletic training they received was fully realized as they went over the top authorities considered that boxing had great value in developing in the individual man the sense of confidence and aggreenviewes that is generally desirable in a solder, while it gives better than any other form of training a sound foundation for modern beyonet-fighting. Boxing and femits are employed the men learn to be quick on their feet. Nor as the mixely theoretical. The Canad in troops who have been at the front report that the aghity and quickness of eye gamed in boxing is a valuable part of the solders exquiring

aphity and quickness of eye gained in bouing as a valuable part of the solders a equipment. Detailed groups of mea who had had previous knowledge of this aport were trained by the boxing instructors to become their assistants. These boxing instructors by the way. have included some world's champion publists. In many camps from the hundred to four hundred evaluant boxing instructors were developed and gave instruction

The growth of the popularity of boxing from a more

siarity of boxing from a more or less forbidden sport to one adopted by the American army was one of the marvels of the war Moreover, the soldiers were rable faus (amp bosits were frequent, even the Y M C A encouraged them, and made them a regular feature of the avanuar moreovers. evening programs in the hute' Last summer 40,600 khaki-clad soldiers and half as many orvilians were spectators in a huge natural amputhentre at a series of bouts between teams representing the 86th di-vision, Camp Grant, and Canadian troops

It as a unique fact that Camp Grant was the only camp in the country where series of bouts between teas

A toboggan of solid snew 35 feet high built by the boys at Camp Grant

utilise the heavy snowfall and cold weather of last winter for winter sports. Six toboggan slides were in daily us and 50 toboggans were at the disposal of the men. dition, 200 pairs of skis and 150 pairs of snow shoes are distributed, while six artificial skating rinks and sen hockey sticks were provide

At Camp Grant use was made of the Brigade organi-At Camp Grant use was made of the Brigate organi-sations as a clearing house for the distribution of equip-ment. Companies desiring to use any of the equipment would get it from the Brigade Athletic Officer and, after ng it, return it for the use of the next organisation. Thus several different groups were enabled to use the same apparatus in one day. According to Captain Lowis Omer, Athletic Director at Camp Grant and formerly director of athletics at Northwestern University, th winter sports proved most efficacious in neutralising the bad effects of the super-heated air of the barracks with its enervating influence. The greatest enemy to the

reason compulsory exercise of the play variety in the open air was instituted at Camp Grant, one hour a day being devoted to this

Camp Grant was also the first to put eross-country running into the scheme of mass athletic training. In the 183d Brigade weekly cross-country runs were held and the men brought to a point where they could run two and one-half miles in sero weather without any bad after-effects. In the middle of January approximately

sero weather without any had inter-direct.
In the middle of Jasauary approximately.
The plan for developing cross-country running used at this camp was later put into effect in other camps.

As was to be expected, baseball proved to be the most popular of the summer sports. Every camp was provided with an immesse field to be used as a parade ground, and, what is more escential, an athletic field. Some of those in the National Army cantomounts were had been appropriated to the summer sports. The summer sports are provided with an immesse field to be used as a parade ground, and, what is more escential, an athletic field. Some of those in the National Army cantomounts were had been supported by the summer sport of the

to purchasing athletic equipment for the two camps and is purchasing athletic equipment for the two samps and for the hoys already in France. The Government provided each company with a certain amount of athletic equipment—about 75 cents a man, which was not enough—but the men in many cares bought some things out of the row money, while every company had an "athletic elect" which they took to France with them. The Y. M. C. A. also made a heavy investment in base-balls, hats and gloves, baselvhalls, medicine halls, boxing gloves and wrestling man; every—"hut" was well progress and wrestling man; every—"hut" was well protected for a "catch" or a set-to in other games. Not only were all of the well-known games, such as basketball, playground ball, volley ball, football, etc., played at the average camp, but frequently the division

played at the average camp, but frequently the division

ngover tricked into denying that he hears, when the destay can array that he doon hear

athletic directors invented new games. And one phase of camp athletics, which is hardly touched upon by the colleges, was laughter-compelling games. This was imornings, was intigrier-companing games. In was im-portant, for good humor is one of the vital elements of discipline. The games were popular, too. In addition to numerous improvinations, leap-froe, prisoners'-base and a dosen other games that even school boys have outgrown, afforded the men intense enjoymant, and served the additional purpose of promoting good feeling and developing self-control, agility, mental alertness and initiative, all bases on which to build military efficiency.

Doctor vs. Malingerer

IT was an observation of the ancients that the greater pain obscures the less and that, in a general way, strong sensations prevent the appreciation of weaker ones. In precise terms, stumuli that are similar in all their properties except intensity are not dissociated by the mind, only the stimulus of greater intensity being so

One of the indoor sports upon which the men fall back in had weather

registered that we are conscious of it. This law was utilised with much success by Dr. John F. Callahan of Brockton, Mass., in the detection of malingerers who sought to evade the draft by false claims of deafness in

one ear—a common practice

When a sound reaches each car with the same intensity we are conscious of hearing it in both. When it reache each ear with different intensities we are conscious of hearing it only in the ear where intensity is the greater. Thus tuning forks vibrating with the same pitch and loudness one inch from each car are heard in both ears; but if the fork at the left ear is removed to a point three DUL II the lork at the left ear is removed to a point targe inches away this sound is itsel and only the fork remaining at the right ear is heard. But if now, the latter is put six inches back, it will an longer be heard, while the loft one, formerly not sensed, will become audible. Dr. Callaham early convinced innessif that tests which

depend upon the suspected malingerer not knowing in which ear he hears the test sounds are an insult to his which ear he hears the test sounds are an insult to his intelligence; the patient can successfully communitate his attention on his good ear and suppress what he hears in his supposedly bad ear. The most we could here expect would be to trick a patient who was not very sharp; and even then we could merely ascertain that he was not totally deal in his "had" one—we could near determine the extent of hearing he had in that ear. So Dr. Callahan has worked out a procedure where the patient knows which ear does the hearing, but where he is betrayed by his ignorance of which one ought to do it if his claims were correct.

The sound is brought to the patient's ears through rubber tubes. It is necessary to eliminate the poss-bility of bone conduction, since the vibration in the tube s can often be felt with the hand So instead of being attached to the patient's head with lugs, the tube-ends

attacked to the patient's head with lugs, the tube-ends terminate in a surred arm attached to the chair-top; and after the patient is seated, these ends are brought to within an inch of his either ear, without any contact between him and the appearatus. The sound may be produced in various ways. Dr. Callahan has used tuning forks, and a megaphone manufactured from an old ether cone. In the foremer case, the desired length of tube is got by a metal clip joining the two tubes, which at the same time makes it possible to use a single fork; and hiji-parts of the tubes beyond the lig simply do not figure in the test. In the wood test, where the cone has actually to be at the physical end of beth tubes, metal couplings and auxiliary tube-lengths beth tubes, metal couplings and auxiliary tube-lengths are used. In either event, the mechanical details are

efficiently obvieus.

If the patient has two good cars, when the tubes are

of the same length he will hear the sound in both ears. There will be a neutral sone of two or three inches around this point in which the same result will be obtained inute either tube becomes appreciably longer than the other, audibility will be confined to the our that ins to the shorter segment.

115

If the patient really has a bad ear, each ear will have en tested separately; it will be found, say, that he hears in his good ear up to 20 feet, and in his bad ear up to 3 feet. With both tubes in use at the same time, he will hear the sound in his good car whenever the length of the tube leading to it is less than 20 feet while that of the tube leading to the bad ear is greater than 3 feet. The minute we get his bad ear within 3 feet of the sound while the good car is 20 feet or more away, he will hear in the bad ear. And proceeding from this point to move the sound nearer to both cars at once, if it is 6 inches from the bad ear and 18 feet from the good one, the intensity of audition will be greater in the bad ear. The patient

will then hear in the bad car, and the good one will register no sound-although if bad ear were closed, he would hear in the good one.

good one.

Suppose now that a malingerer has claimed deafness in his left ear. If he claims partial deafness he will be tripped up in short order by sounds whose intensitics and distances are not known to him; so realizing this, he claims total deafness in the ear in question. He must then go into the test with the determination to say no whenever he hears a sound in his left car; otherwise he will presently admit hearing something which he should not hear. Very well; in the case outlined in the preceding paragraph, he hears the sound in his had our, and denow hearing it at all. Then he is caught; for if his left ear were deaf he would liear it in his right, and if his left ear would hear it in his right, and if his left ear were not deaf he would hear it in his left. Of course the distances in the above suppositious case will be greatly modified according to the facts of each case. every case there will be a region where the malingerer hears the sound in his "bad" ear, so that he must deny hearing it at all,

yet in which he could hear it with one ear or the other if his claims were true. Thus, suppose he really hears at 30 feet in his left car and at 20 feet in his right, and has claimed deafness in his right ear. When the tubes are so adjusted that the source of sound is 10 feet from his left ear and 6 feet from his right, he will deny hear-

ing at all!
In every case the range of the good car can be deter-In every case the range of the good ent can be determined in advance by separate twist of the two cars; and in every case the patient, by his negative answer, unconsciously gives exact information as to just what degree of hearing he has in his alleged had ear. For as degree of nearing ne has in me nieged nad ear. For as the sound-source retreats firm the good ear and ap-proaches the bad one, he marks the point at which he begins to hear it in his bad ear by changing his claim from "hear" to "do not hear." There seems no escape for "hear" to "do not hear." There seems no escape for the unfortunate victim of Dr. Callahan's ingenious de--except that of telling the truth about his hearing to begin with.

The Principles of Camouflage—II

Low Visibility and Optical Illusion on the Sea By M. Luckiesh

Al the time of the Spanish American War our battle ships were painted white apparently with little thought of attaining low visibility. Later the so-called thought of attaining low visibility. Laker tin securing that the property of the first page and to close observers that this gray is in general too dark Apparently it is a mixtum of black and white. I has ships of the British navy were at one time painted black but preceding the Great War their coats were of a warm preceding the Great war that contact with the ward dark gray Germany adopted dark gray in fore the close of the last century and Austria Lipited the German gray at the outbreak of the war. The I reach and Italian gray at the outbreak of the war. The rean and radian fleets were also paintful a warm gray. This develop-ment toward gray was the result of an aim toward at-taining low visibility. Other changes were necessitated by submarine warfare which will be hiscussed later.

by submarine wariant which will be inscussed later it the early days of unristricted submarine warfare many schemes of modifying the appearant of vossels were submitted. Most of these were incredy wild fanoise were submitted. main senomes of modifying the appearance of vessels were submitted Moret of these were incredy wild fanous with no established reasoning behind them Here again senenc came to the reason and through research and consultation hally straightened out matters and consultation healty straightened out matters are lequestion of low visibility for vessels could be the oughly studied on a laboratory scale because the seaseape and natural lighting conditions could be reproduced very closely I wen the gueral weather conditions could be amulated although of course the experiments could be prosecuted outdoors with small models as in deed they were Dr I A Jones carried out an in vestigation on the shore of I ake Ontario and laboratory vocupation on the snort of I ako Ontario and laboratory experiments were conducted by others with the result that much light was shi i on the questions of marine camonifing. I his work confirmed the conclusion of the writer and others that our battle ship gray was for dark. Of course the golds that

was too dark Of course the color best adapted is that which is the best com promise for the others warrely in lighting and weather conditions. These vary in different parts of the world so naturally those in the war sone were of primary importance. All camouflage generally must aim to be a compromise best suited. am to be a compromes ose suiter to average or dominating conditions. For example in foggy weather a certain paint may render a ship of low visibility but on a sunny day the ship might be plainly visible. However if ships are rendered of low visibility for even a portion of the time low visionity for even a portion of the time it is obvious that an advantage has been gained Cloudiness increases generally from the equator northward as indicated by meteorological annals

A Scale of Visibility

In order to study low vasibility a scale of visibility must be established and it is cosenulat to begin with the fundamentals of vision. We distinguish objects by contrasts in brightness and in color and we recognise objects by these centuates which mold their forms. In researches in vision it is customary to devise methods by which these contrasts can be varied. This is done by increasing or decreasing a veil of luminosity over the object and its surroundings and by other means Much work bas surroundings and by other means made work has been done in past years in studying the minimum perceptible contrast and it has been found to vary with hue, with the magnitude of brightness and with the size of the image that is with the distance of an object of given use. In such problems as the one much sesentials over can be drawn upon. A simple though rough each of variability may be made by using a scrise of photographic screens of different densities. A photographic screen is slightly diffusing still the object can be viewed through it very well. Such methods have been employed by various investigators in the study of visibility. Owing to the curvature of the earth the distance at which a vessel can be seen on a clear day is limited by the highly of the observer and of the ship is upparticularly form an observer in a cortain position the visibility range with the contract of the con

varies as the square root of the distance of the object from M. Such data are casily available so they will not be given here. So far we have considered the ship itself when as a matter of fact on clear days the smoot cloud emitted by the ship is usually vasible long before a single superstructure appears over the horizon. This led to the prevention of smoke by better combustion, by using smokedes fuch, etc.

The irregular skyline of a ship is perhaps one of the most influential factors which tend to increase its visibility. Many suggestions pertaining to the modifica-

tion of the superstructure have been made but these are generally impracticable. False work suffers in heavy sens and high winds

Countershading to Ingrease "Low Visibility"

After adopting dark gray as a low-visibility paint for ships perhaps the next refinement was countershading. that is shadows were painted a lighter color or even white The superstructure was painted in some cases a light blue with the hope that it would fade into the light blue with the hope that it would fade into the datant horizon. However, the effectiveness of the submarine domaided now expedients because within its range of effectiveness no ingenuity could reader its prey invasible. The effective gunfire from submarines is several miles and torpedoes can be effective at these datances. However the submarine priors to discharge the torpedo at ranges within a mile. It is obvious that in average weather low winbility cased to be very effective against the submarine. The movement of a target is of much less importance in the case of gunfire than in the case of the torpedo with its relatively low velocity The submarine guiner must have the position range and course of the target in order to fire a torpedo with any bope of a ht. I herefore any un-certainties that could be introduced pertaining to these factors would be to the advantage of the submarines prey. For example low visibility gave way to con-tumbility in the discussions of defones againt the sub-marine and the slogan, "A mass is as good as a mile" was adopted. None of the foregoing factors can be determined with high accuracy so that it appeared possible to add somewhat to the difficulties

THE art of deception in war is as old as war itself, but never has it I received such close scientific admition as in the mighty struggle the world has just passed through Early in the war it became evident that while natiti might deceive the naked human sys, the deception would be perfectly transparent to the photographic camera. A complete humahele of the composition of color was importable. Here the service of the physicist had to be called in Not only was color used to boodwink the sureny but all manuers of optical illusions, here also the physicist was needed. And so many prominent scientists were enlisted to reduce camouflage to a science.

Among the physicists who had contributed to the scientific development of comediage was the author of the present article, who is a well known color expert. In Luckish, therefore, writes with authority. He start installment, dealing with comouflage on land, was published in the SCIENTIFIC AMERICAN of January 25 1919. The third and last installment, with well be published in a vary tesses, will deal with installating of sirplanes —EDITOR.

Optical Illusions to Distort the Lines of a Ship

Many ontical illusions have been devised and studied by scientists In fact, some of these tricks are well known to the general reader Straight lines may appear known to the general reader Straght luess may appear proken, convergent, or divergent by providing certain patterns or lines intermingfed with them. Many of these were applied to models in absoratory experiments and it has been shown that continuous results as to the course of the vessel. The application of these on vessels has resulted in the groteque patterns to be seen on stips. It is well known that these illusions are most ships it is well known that these littiatings are most offective when the greatest contrasts are used, hence black and white patterns are common. Color has not been utilized to any appreciable extent in confusibility although there is a secondary aim of obtaining low although there is a secondary aim of obtaining low vanishity at a great distance by properly balanoing the black white and other colors so that a blue gray results at distances too great for the individual patterns to be received by the eye Color could be used for the purpose of increasing the confusion by apparently alterns the perspective For example, blue and red patterns on the same surface do not usually spepar at the same distance, the red appearing closes than the blue that the surface of the same control of the color of the the loss of the alternative the same than the colors the hose of the alternative the same than the properties by which we estimate the course This was the final type of commontance at the older of the war. Bealeds relying

which we estimate the course. This was the final type of camouflage at the close of the war. Besides relying upon these illusions, ships signsigned on being attacked and aimed in other ways to confuse the comp. Little attempt was made to disguise the bow because the bow wave was generally visible. However, attempts have been made to increase it apparently and even to provide

one at the stern. In fact, ingenuity was heavily drawn upon and every plausable expedient has been tried. The convoy system is well known to the reader. Thus saved many vessels from destruction. Vessels of

The convoy system is well known to be resource. This saved many received from destruction. Yearch of the same speed were grouped together and established floors across the Altendard of the same speed were grouped together and established floors are the Altendard of the same speed o during the submarine meance

Naturally smoke screens were adopted as a defensive measure on sea as well as on land Many types of smoke boxes have been devised or suggested. The smoke is produced obemically and the apparatus must be simple and asfe I is merchanium were attacked by a submarine immediately smoke-boxes would be dumped overboard or some which were installed on deck would be

overboard or some which were installed on deck would be used to be used in a signag course. These expedients were likely to render shell fire and observations inaccurate. This mode of defense is best suited to unarmed or inferiorly armed vessels.

Camouflage for Submer

So far as the writer has been informed no attempts have been made to camounting submarines under water but that this can be done is evident from aerial observations. When looking over the water from a point not far above it we are unable to see into the water except as points near us where our direction of vision is not very oblique to the surface of the water. The brightness of the sur-face of water is due to mirrored sky and clouds ordinarily For a perfectly smooth surface of water the reflection factor is surrises of water the renection factor is two per cent for perpendicular medicace. This increases only slightly as the obli-quity increases to an angle of about 69 degrees. From this point the reflection

quity increases to an angle of about 80 grees. From this point the reflection factor rapidly increases, becoming 100 per cent at 90 degrees incidence. This accounts for the case with which we can see into waters from a position directly overhead and hance the airplane has been an effective hunter of submarines which the second water of the seed at which an object can be seen water of ourse depends upon the clarity It may be compared to the seen water of the seed of the seen water of the seen water of the seed of the seed of the seen water of the seed o hues and reflection factors of earth and water areas it would be easy to camonifies submarines effectively from ensemes overhead. The variability of submarines it amplified by vewing large fish such as sharing from airships at low altitudes. They appear as ministure submarines, dark gray or almost black smile greening bilus surroundings. Incodentally the color of water varies connectarably from the shallow island waters containing much suspended matter to the deep olear cosms without the submarines. Cell the submarines containing much suspended matter to the deep olear cosms without the brightness of the former under the panne such ditions and are decidedly bilus raliand waters such as the Chesapeake Bay are very greenish in color.

Worlds of Four Dimensions

A Field of Mathematics Equally Interesting to Student and Layman

Fishs infinite variety of topics to be found in mathe-public appeal. The enterpola statement of the mathe-matical that the carde cannot be squared or the cube couplisated or the angle traced under the rules which he has lead down to govern stack upon three problems always irritagues the lay mind. And in the same way as imposed to the coupling of the coupling of the same description of the coupling of the same description and the coupling of once is the most casual mention of the fourth dimension and four mutually perpendicular lines through a point. For here are phrases which convey a meaning to him, and moreover a meaning that seems to contradict all his appariences, so he feels that he must stay with them asperiences, so he feels that he must stay with them choording to has type of mind he will stay to seed or stay to learn, but he will stay we have yet to meet a person of includence who was not sufficiently attracted by the term "fourth dimension and the things it suggested to want to hear more about it Many of the readers of the Scientric American will result the price somptition of nearly ten years ago for onesys explaining what mathematicans mean whom they speak of the fourth dimension. The number of consequences of the stay of the stay

stants was so large, and the collateral interest so widespread, that publication in book form of a few of the etter of the essays seemed worth while It turned out to be so well worth while that the edition was exhausted Do so well worth while task the doilion was exhibited and the book has been out of print for some time. A new action has recently come from the press, and its peruals by one who had not previously seen the book is responsible for these remarks. The volume contains, in addition to the prise-winning easily and a brief afterword thereto 20 of the computing season and a brief afterword thereto. 20 of the computing

cessay and a brief afterword thereto 20 of the compoting cessays selected purely with a view to presenting as many sepects of the subject as possible, and a comprehensive and well-excusted introduction by Dr. Manning of Brown University, one of the judges in the competition at wax to be expected, the sees judge in the competition and almost unanimously upon the better-known features of four-dimensionality.

The natural passage to four dimensions by considering in order point, line, plane solid and hyper-solid is found in most of the seasy as in a great deal is said about flatiants and worlds of our. Immunous Even in this satcher hackeyed field however we find a wide choose of illustrators, and particularly pleasing is the variety of the arguments offers in inconnectation of the number of points, lines, pluse and three-spaces necessary to defaunt the tessenate or hyper cube in four dimensional configurations.

The usual amount of space is devoted to the tricks of the fourth dimension—the ponetration of closed com-partments the appearance and disappearance from three space, the interchange letween symmetric forms the turning inside out and the unraveling of knots without disturbing the ends—although in several cases it is necessary for Dr Mannin, to interpose the weight of his authority between the in lividual contributors and the errors so commonly found in discussions of these

A point which will be r w t some of those interested in hyper-space is the fut that cert un chemical isomers appear to differ only in that their molecules or crystals appear to differ only in the term more discountries and armmetroally instead in the term of the free passage from the one form to the other vilutions of manufestation of emical change and with sit collition or consumption of heat An explanation of such changes—though hardly the only explanation a some of the essayists assert —would be found in the hyl thesis of rotation through the fourth dimension. Now of those who advance this possibility makes the rather obvious suggestion that if our space has an infinitesimal thickness in the direction our space has an inflatteninal thickness in the direction of a fourth dimension and if p neitration in that direc-tion be physically impossible value to the extent of that blukkness, the occurrence of s1 is rotations only in the inflatteninal would be accounted for Perhaps the most notice within of the unfamiliar ideas

advanced in this little boil is that which suggests that we visualize time as a fourth dimension and consider bodily growth, observed at a series of different stages, as a series of cross sections t ken across the fourth dimension. Such a group of trees as the geometer would doubtless permit us to call them perhaps com

would doubtless pormit us to cit ities perhaps comes as close to actual realization of a fourth dimension in our world of points as we can hope to come But why confine the decision to a world of points? It has always seemed to us that the doctrine of hyperidimensionalized yaffers a distant loss through such confinement. It is true that we humanis conceive of married and amounted as a manifold of points. The very fact that we work that the contraction of the very fact that we humanis conceive of our surverse as a manifold of points. do so conceive however in conjunction with the fact. that the universe of our perceptions is indulitably three-dimensional in points suggests strongly that light would be thrown upon the concept of four-dimen sional manifold of points by the construction and consideration of four-dimensional manifolds of other

Our own familiar three-space is four dimensional in lines and if it is unnatural for us to think of the line as the element of which space is constituted, we can at least the element of which space is constituted, we can at rast of force ourselve's to do y and then a mit the slightlest a prace reason for not dying see our space is fur dimensional in sphere, and actually say dimensional in circles. These of us who has heard Dr. Keyser talk or who have rere il his seasy on the super (of mathematics or who have rere il his easy on the super(of mathematics). will realize well that mathematically, the point as the space element is purely an accident and that even so complicated an element as a pencil of lines is by no means unthinkable

In several places notably in the introduction 'The Fourth Dimension Simply Explained has a good deal to say of the sort of non-Fuchdean geometries got by imposing upon Fuelid's point-element siternative sets of postulates. These systems in itself throw light upon hyper-space and hyper-dimensionality but we do not see that they throw marly so much light as this other see that they throw means so much ugan as this concr sort of non-Fuchidean geometry got by imposing the Euclidean or Lobatchevskian or Rumannian postulates upon a set of elements other than points. Our one regret in leaving this absorbing volume, is that it has nothing to say under this head

A Strong and Adequate Navy

To the Editor of the SCIENTIFIC AMBRICAN
I am greatly pleased at the attitude of the article
by Mr Hudson Maxim in your uses of January 4th as
to increasing the size of our Navy I am onthussantle
about manufacturing a strong and assenguate array. The
thickness of the size of the size of the size of the size of the
thickness of the size of the size of the size of the
thickness of the size of the size of the size of the
tenager than that of any other naval power, except
England, and, remembering that Germany's strength
of England I cannot agree with Admiral Badger and
the New York Times (January 12th) that now is the time
to appead up and take first place
To understand the magnitude of that proposed expassion one has only to look at the figures comparing
hava's tomage buitt and building, as shown in our
official Navy Year Book (1916, the latest issue, p. 646,
insect) To the Editor of the SCIENTIFIC AMERICAN

official Navy Year Book (1926), the mean same, p. 648, insert, seed. 27,127,850 cm, built and building. Harmany—1,120,4890 tons, built and building. Emplained, in her increased "geographical situation, bordended "geographical situation, bordended the her increased "geographical situation, bordended the her increased and the same and the same

in naval expansion at this time especially as some of those now urging, thought before the war that third or fourth place was pleuty good enough for this country the richest nation on earth. We then carried a national We then carried a national lollars We shall soon carry debt of about one billion dollars. We shall soon carl a national debt of over twenty billions. How can the demand that we pour out the unstinted money that such a program will call for? As a very clear-headed old sea dog the admiral commandant of the Brooklyn Navy Yard said to the Naval (omnittee of Congress in m) 'A naval officer has been trained to spend

money not to save it

It is my belief that a navy of equal tennage would cost the United States at least 20 per cent over England owing to our higher wage scale and more extravagant navel management (for example our maintenance of political or sectional but absolutely unnecessary navy yards)

How much easier it would be with this enormous debt staring us in the fact for Congress simply to make adequate provision for the fundamentals-dr battle-cruisers and destrovers-of a reasonable navy, and to slow down on all other construction to the lowest cossible firmit, building only enough submarines and hydroplanes fully to stimulate invention and in provement, no more They should put saide the idea that a navy, to be efficient must man and maintain every naval vessel and burn coal or oil under every naval

After all our troops are brought home, the obsolete attleships of the second line could be put "in ordinary" battleships of the second line could be put "in ordinary" in the fresh water basin at League Island Yard, together with all obsolets crusers destroyers, submarines, and other naval orale. With only the modern up-to-date ships, built and building in active commission, we would still have a Navy that every loyal American could

be proud of, both as to efficiency and economy
Persals me to congratulate you on Mr Maxim's
splendid and sensible article

Gase, A Love Lx Member of Congress

P. 6 -- I served 11 years on Naval Committee and one year on Merchant Marine and Fisheries I served also in Dewey's first at Battle of Manila

The Transatlantic Airplane Hoax

To the Editor of the SCIENTIFIC AMERICAN There has been so much printed recently indicating that the successful transatlantic airplane flight is a thing of the future though one looked forward to with great expectations that I beg to quote the following from the correspondence column of the San Francisco Chronicle of December 22d, bearing the signature E W B. Berkeley Cal

the information of A W ('For the information of A W (Grass Valley whose inquiry regarding the crossing of the Atlantia by an airship appeared this morning please be informed that such a flight was made July 28th 28th, 1918 to celebrate the birthday of Mr Allou E Hawley, president celebrate the brithday of Mr. Allon R. Hawirey, president of the Aero Club of America. The start was made from Harbor Grace. Newfoundhand at 4 02 P. M. (seven hours, two muutes, Greenwich mean time). Sunday, July 28th and the landing at Dingle Bay Ireland, at 412 P. M. (seven hours, twelve minutic Greenwich mean time). Monday, time 24 hours 10 minutes. For an interesting description and anygators log of this flight, see United States. Naval Institute Proceedings, Vol. 44 M. No. 187. Seatomber, 100. Vol 44, No 187, September 1918

I am a close reader each week and have been for a great many years of your publication but I am unable to recall that your columns have recorded the fact that the Atlantic has already been successfully crossed by a flying machine Assuming that the subject matter of this communication interests a large number of your readers, would you not at your convenience reproduce this communication in your columns and advise whether vou can confirm?

JOHN S INCLIS

San Francisco, Cal

(The flight to which this correspondent refers was a fictitious one The yarn first appeared in Flying and was reprinted presumably on the ground of its historic interest, in the Naval Proceedings. We do not know whether it was originally intended as a hoar or whether it was assumed that readers would recognise that the account was purely fiction. Judging from the number of letters which we have received and of which the obser is but a sample, we should say that the omission clearly to state the fictitious character of the original publication and of the reprint was an unfortunate one—The Liston

Model airpiane in position to display pitch (left) roll (center) and yaw (right) when blown upon from the opening in the background. In each case L represents the assertacle lens which admits light to the chamber, and A-A the pencil of light which is deflected to a scale on the roof and there records the oscillations of the plane

The Instability of American Airplanes

Sources of the Defects That Have Killed Many Pilots Revealed by Experiments That Reduce Aerodynamics to the Elementals By W. H. Ballou, Sc D

TITHING the Hodgkins find for the advancement of science of which the Smithsonian In-stitution at Washington is custodian infersive investiga-tions have been mado at the Massachusetty Institute of Technology Boston on the dynamical stability of American airplanes together with the wind tunnel experi American airplanck together with the wind tuined experiments in aerodynamics. He investigators comprised Assistant Naval Constructor Irome (U.S.N. Capitain V. E. Clark U.S.A. C. I. Brand T. H. Huff D. W. Douiglas II. K. Chow. F. Buckingham H. F. Rossell and F. B. Wilson Bach-lors and Masters.

The technical reports rendered by those competent investigators roveal defects in American designs that are responsible for so many secidents and deaths of art responsible for so many accidents and deaths of apperatures and professionals on the transing grounds of this country and which have been laid to encoun-sabotage apparant) without cause. These accidents and deaths have run in greater percentage on practice work at home than in actual warfare abroad with foreign maximus harring of course machines and men-dicativosed by hostic fire. The inference form the reports with a function insandartures have not taken the same corrective advantage of remediers as have foreigners who have had constant inspection of machines in America there were merely trials of ma chance abroad machines got their tryouts in actual service resulting in quick remedies of many defects

It may be stated in advance that the investigators have not found remedies for all defects 1 ar from it Avia tion is still in the experimental tion is still in the experimental stage. The defects and remedies pointed out apply only to what applianes are to-day. The perfected urplane is a matter of tomorrow that is the ariplane which like David Haruns borse, will stand without lutchin and a woman can drive it. A perfected airplane will be a machine that will wholly replace the automolile that men wemen and cluideen will be as safe and as lengthed with as the automobile and as capable of driving also one that will really annihilate An attempt will be made

herein to summarize in under standable language the reth reports of the sirplant investigaports of the arpant investiga-tors within the limits of an article omitting very properly the names of the manu facturers, who, under the stimulus of war will un-doubtedly take full advantage of any and all remedies offered conclusively Where possible, exact quotations will be made but much reduced. Much of

the cpr innental work was performed by Masser Hiff and Douglas. The secillating apparatus for longitudinal and Douglas and deepend by Mr. Chow under direction of the control of the contr the experimental work was performed by Messre Huff

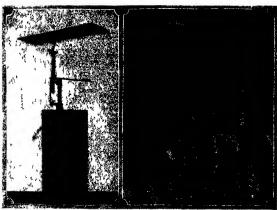

accidental cause, is a slow undulation involving a range and sinking of the arripanes well as a pitching motion. The undulation is stable for high speeds since it is rapidly damped out. At lower speed, the undulation is less heavily damped until at a certain critical low speed the damping vanishes. For speeds below this critical speed the undulations tend to increase in amplitude with each swing and the longitudinal motion is therefore unstable. The military anoshim showed a critical speed below which it was longitudinally unstable of longitudinal shall be a simple matter to secure any desired degree of longitudinal shall, when the first time

pointed out by the use of properly inclined tail surface and light wing loading Excessive statical stability as indicated by strong restoring moments is undesirable and may cause the motion to become violent in gusty and may easise the motion to become violent in guity are Ihu violence of motion may seriously impair the pilot's control and the airplane may take charge at a critical time Longitudinal motion for any particular speed may be made dynamically stable while at the same time only slightly stable in the static seeme, by the use of large fail surface which lies very nearly in the relative wind If the minimum of statical stability be combined with the maximum of datings the pitching will be very slow and heavily damped The longituding the stable and yet be without violence of motion in guids.

be without violence of motion in gusty air. In general primitive among pilots against 'very stable aerplanes is believed to be justified. It cannot be too strongly insisted upon that true dynamical stability is better given by damping than by stiffness Peperanes with rolling vessels has left to the design of types of small metacutire height (a measure of statical stability), fitted with bulge News (damping surface) for

stability), fitted with bulge keels (dampling surface) for passenger carrying. Here an infort is made to get away from the violence of motion associated with stiffness. We determined necessary accordantaled constants by wind tunnel experiments whenever practical and calculated by simple approximate method two confinents which cannot be restally found experimentally. The shareder of the motion is considered to the second of the control of

algebraically It was ascer-tained that lateral motion is and side alip, or skidding One type of motion is a spiral subsidence if stable, or divergence if unstable One type of one type of the control cace if unstable One type of machine becomes spirally un-stable at low speed. The motion is a spiral dive, due to an overbank and a side slip miwards. The airplane makes a rapid turn with rapidly increasing bank accompanied by side slipping inwards. The instability is such that an initial deviation from course will domble transfer about will domble transfer. will double itself in about seven seconds Such spiral motion may be made stable by adequate fin surface above the center of gravity or upturned wings and by reduction m weather helm due to too much rudder or fin surface aft The American mulitary ma-chine showed the same sor on the showed the same sort of spiral instability at high speeds. It had no dihedral angle of wings but had a large rudder and deep body."
Whether so intended or not, the above paragraph

'A second type of motion as called the Dutch roll'
from analogy to a figure in ice akstung. The aurplace
takes up an oscullation in vaw and roll simultaneously
it swings to the right banking for a right turn, then
swings back to the left banking for a left turn. The
combined yaw and roll has a fairly rapid period
proved the period is at accorded and an initial amplitude
is damped to belif value in less than two seconds. At
low asced the nerrod is 12 seconds dauged to half

is damped to any value in sea strong to verseous of the period is 12 seconds damped to half from an approximate calculation that the Dutch roll may become mentable if an arripane has too much high fin surface and if there is not sufficient weather helm or rear fin surface. Those conditions are the reverse of those of april mistability. The conflicting nature of the requirements augustes that han arripane is unlikely ever to be unstable in each sense it also indicates the difficulty of obtaining lateral stability by raised wing tips. Thus our multery merchine was spirally unstable at high speed and stable with the Dutch roll At low speed it was spirally stable that the more of the spirally stable than the speed in the spirally stable believed that the majority of arribance of ordinary type are spirally untable because of excess of fin surface aft. When attempts have been made to remedy this fault by use of a large dishedral angle upwards for the wings, matters have been made worse of it is only to be expected that the order ordinary type and the spirally stable that the order ordinary type are spirally untable because of excess of fin surface aft. When attempts have been made to remedy this fault by use of a large dishedral angle upwards for the wings, matters have been made to remedy this fault by use of a large dishedral angle upwards for the wings, matters have been made to remedy this fault by use of a large dishedral angle upwards for the wings, matters have been made to remedy this fault by use of a large dishedral angle upwards for the process of the stable process of the s

Dutes rut district on less viocates hay be introduced. Especially in guards to produce violent folling. Our experimental ruschius with a slight rate of wings about 16 degrees and a small rudder has shown that at ordinary speeds it is stable in every sense. longitudinally and laterally, and that it is possible to seemer a degree of stability in every airplane of conventional type. But whether this stability is excessive in turbulent air pie each particular machine can only be determined by actual flight is it.

"If as airplane be unstable in still set it is obviously

"If an airplane be unstable in still set it is obviously worse off in guite. The boursess is unfortunately not true, since it may be very stable in still arr yet be so stiff finish it utpulsent air that it will be violently tossed about. It is conservative to conclude that airplanes should not be unstable and that they seed not be, almostight changes in the nature of adjustments suffice to conseque, such instability of motion. With military planes inside the none of first, the probability of controls where the summer of the probability of control where the summer of the probability of control of the summer of the summer of the probability of the summer of the

use when those controls [1] and it should be judged only as an accessory to usest a pilot rather than as a curs-all for inherent init if it of an arriance a motion. There is no use to sack radical tange, of type to accurstability when an ordinary type of plane kinds itself to adjustment which make for inherent stability of motion. Freak airplaints of great stability may be consurely stable in some ways and frankly unstable in others. It is likely that the coming most satisfactory airplane may be only slightly stable and that it will in any possible attitude he cash, outrolled by the pilot just such a machine was anomined in press dispatches from London researchy at I alled The I only I have the controlled by the pilot of the cash. A Home-Made Machine for Cold Plate Bending

A YAR or so ago a shill huiding concern in Penascale. He shorth was realing it completion a new plant, went into the open markst in scrib of a set of cold bridge gold is that would foll plates up to 30 feet in length. They found that the best they could do would be to pas about \$850 000 for a set which could be delivered to them in 15 months or thereabouts so it became necessary for them to devise some sort of a substitute for the conventional rolls. The result is the plate-bending medium dilustrated herewith

This machine consists of a structural frame with backing up brackets and squired had former setting on a concrete formulation. In plate to the best are placed on edge in the machine between the brackets and the formers as shown in the photograph. A sense of chains attached to the structural frames passes over the end of the plate thence over these was anchored to the end of the plate theme over the end of the plate theme of the plate to be best to a uniform radius a master valve is opened whith controls all the cylinders and applies a uniform pull on the plate of the plate in the proton of the plate more than others the master valve is openium or than others the master valve is openium on the plate more than others the master valve is openium or than others the master valve remains out of action, and

cyluders and applies a uniform pull on all the chains If it is district to bend any portion of the plate more than others the master valve remission out of action, and the appropriate individual valves go into operation By raising or lowering or advancing or retarding the backing up brackets or the forters a the plates can be

bont to any desired radius

The machine thus developed met the
emergency against which it was designed,
for it cost about \$15 000 and was ready
for operation in less than three months

"Liberty Fuel"

A GIOD deal has appeared within the past few seeks upon the motor fuel invended by two army officers and the general tone of this entotics coughted with the suggestion of governmental acceptance carried by the nane under which the new compound was amounted line ted to a rather enthinsiation find it is soon to right a good to replace good the sale. If was not for a long time possible to get data on which to bean intelligent comment but price department of January 14th at last, inter this need.

If that last met thus need the appears that some 65 per coat of the new fuel is bens) while of the kerowen previously announced as the base, there appears that 25 or 36 per tent. To anyone acquianted with the supply and demand for bensed the parts the Latert Fuel on the defensive at once If all the housed which we are now producing could go into far mudafeatines it could not be made in sufficient quantity to replay more than two per cent of the gasolius which we now which we now which we now which we have

of the gasonin which we have us. The descript Fuel Of course this does not mean that 'Laberty Fuel Of course this does not mean that 'Laberty Fuel But it does mean that for the present it as not to be thought of Only by a complete revolution in the ways of gatting bearol and probably in the sources of supply as well could a fruit ornizining 55 per cuit of this substance become a commercial proposition. When to this is added the further returnments that the invitories would not apply the Bureau of Standards with their formula too finally gain some of at for test if Louds everval grave technical defects at seems quite clear that the whole thing is more of less of a bubble.

SHANGHAI

THE plows of Egypt are still being pulled by oxen Ablebodied Hindus are carrying building materials on their backs. Progressive Japan still has jinrickshaws.

But labor grows scarce Man-work must be diverted to fields where it can best serve. Muscle is fast losing the right to compete blindly with mechanical power.

Egypt is already taking up farm tractors. Motor-trucks must go to India. Japan will replace jinrickshaws with taxicabs.

Wasteful methods are falling by the wayside. The age of machinery will not be denied. The work must go on.

CALCUTTA

HELIOPOLIS

SINGAPORE

THE age of machinery spreads outward from America During the ten years ending 1916, nearly \$1,150-000,000 worth of American machinery was shipped to all parts of the world.

In America alone, 125 leading manufacturers of power machinery specifically recommend or endorse the use of the Vacuum Oil Company's Gargoyle Lubricants to the purchasers of their equipment.

Vacuum Oil Company Branches and representatives dot the earth. Men serving under the red Gargoyle have taught unaktiled Malays how to operate their American engines. Oriental and African misuse of lubricants has been corrected. The more intelligent peoples who lacked mechanical carefulness have become informed.

New inventions often bring new lubricating saceds. As these needs arise they will be met by new Gargoyle Lubricants. To safeguard the correct operation of machine ery going to all parts of the globe, the Vacuum Oil Company maintains an ever-expanding world organization.

The work must go on.

Mechanical Equipment of the Farm

Latest developments in agricultural machinery and practical suggestions for the farmer

C and and by HARRY C RAMSOWER Professor of Assicultural Engineering Okio State University

A farm tractor with broad, cleated wheels for field work and rubber-tired wheels for service on reads

A Rubber-Tired Tractor

THERI seems to be no lack of new ideas in the dovel numerit of farin tructure. Road work with a trantor while much faster than toam work has seemed trator while much lister than toam work has seemed to many to be rather slow. Speeds of from \$25 to 4½ miles per hour are about all average tractors make With the regulation wheels equipped with lugs it is perhaps not wise to run a tractor on the road faster. than this because all parts would be subjected to too much iar and strain

A prominent eastern company has solved this probelm by providing one set of regulation wheels for heavy traction work and another set of rubber tired wheels for road work and another set of runer tired wheels to the other is easily and qui kly made. With the rubber tired wheels a speed of ten miles an hour is possible and the wear and tear on the machine is reduced to a minimum Of course there are some drawbacks to such a combination as for example the additional cost anten a communitation has for example, the ad fill half cost of the extra wheels. To I alance this however is the fact that with much hauling to be done a remarkable saving in time would be effected in the course of a few

Aside from the road wheel feature this machine is a r il tractor It is built on neat attractive lines and material of good quality seems to have gone into its making. It is equipped with a four cylinder motor 4 inches by 6 weighs 3 850 pounds and is given a rating of 12-24 horse-power It seems to handle a three-bottom plow in a very satisfa tory way

One feature of especial note is the convenient and comfortable sust for the driver. The awkwarl un comfortable position which the driver must assume on many tracters constitutes an everlasting objection On some ma hines the driver must sit strad lie to the motor or frame, and cannot evall, change his position. To stin such a manure for several hours at a strict in stresom to say the least. The driver too is quite well protected by the very ample guards from the dust ard dut thrown up in the field by the traction wheels a feature well worth c nadering in the jurchase of a tractor

Keeping Farm Roads Fit

THF roads and lance on the average farm fall into a liner or less disreputable condition during the winter and spring months making passage ever them for teams or stock difficult and disagreeable. In a large part neglect is responsible for the condition It is quite

Using a grader for open ditch work

possible to make a good road out of earth and keep it good. A good road, his a good house must have a good roof and a dy cellar. Adequate underdrainage by way of a line of tile on one or both aides of the road will provide the dry cellar. and a smooth surface with good

The grader or terracung machine shows on this page, is inexpensive and yet effective in grading up the road When drawn by four or an knows as mile of road can be graded quickly and well. Once graded it will be necessary only to go over the road sitter heavy rains to fill up stock and wagon tracks and rub off high spots so that water may not stand on the surface. A splicing drag or one made of planks will accomplish the same purpose after the properties there are the properties of the propertie

drain tile

The road grader drawn by a tractor shown on this page, rupresents an interesting combination A 30-foot roadway is completely covered in a single operation Several miles of road can be touched up in one day with such a rig. The tractor is doing the work of 24 horses and six men.

Lack of Equipment in the Farm Kitchen

Lack of Equipment in the Farm Kitchen
THE statement that the American people have been
much more tordy in the purchase of modern laboraeving oquipment for the farm home than they have for
the farm proper and for the barn reaanch be successfully
contradicted. The sixtle has been replaced successively

One reason for the lack of equipment in the (Continued on page 128)

The machine above used as a road grader

A 25-50 tractor grading a 36-foot rend in a single operation.

The 14-inch naval gun, on its specially designed car, used for shelling the German terrain for 30 miles back of their front

DURING the closing days of the year 1917, ordinance experts of the U S Navy, who had been closely watching the trend of events in the great war, became incessly inserted in the effect of long range bombard metals and the second of the control of more often not)

While the Navy's limited testing facilities proving ground with a range of only 18 000 yards—had never permitted the firing of its big guns at high angles of elevation, it was felt that the 14-inch 50-caliber naval rific was superior to any German gun built, in range, accuracy and striking power

The 14-inch naval gun throws a 1 400-pound projectile

at a mussle velocity of 2,800 feet per second. With the Navy type of shell its maximum range is well over 40000 yards or 22 miles, while using a special shell designed for firing at extreme ranges a range of about 55 000 yards or 29 ½ miles was possible Areas for destruction not hithorto touched were

opened to a gun of this range Troop centers lines of communication, railroads, reserve store houses and sumilar strategie points almost too numerous to mention could be destroyed by such guns If mounted so that eould move rapidly from target to target, their possibilities were almost unlimited were urgently needed Rear Admiral Raiph Earle, Chief of the Navy Bureau of Ordnance recognized that need and saw that if a battery of 14-inch guns could be placed in action on the fighting front in I rance by the

summer of 1918, they could render a real service to the

It was decided that the emergicy was such as to It was deeded that the energ rev was such as to warrant using guins for this purpose this were intended for replacing damaged guins if the Fleck Risks had it be shouldered in making that desire but in time of war and noed, responsibilities are heavy in all matters it was therefore, proposed to I suld mobile mounts if r the guins (which meant rashwir meints for in no ethics way could the 38-56 in Hearth guin let transported) completely equip them and place it lem in action in France before the close of the summ righting in 1918

In less than 30 days, complete designs were prepared which called for a battery of five guns each gun car train to be provided with a lo mustive for hinding it two ammunition cars three berthing cus to house operating personnel a crane car flat cars and gond la cars for carrying material as well is oth r civiliary cars. In addition to the hve gun car trans a sixth train was provided to go independently fr in one gun position to another. The equipment totalled five gun cars six locomotives and 72 cars

The gun car consists of two large bridge girders tied into a single unit. T2 feet long only wighing 68 tone in the wall between the two quietes sim int of the 4 in which and a gun which with yoke and 1 r h mechanism weighs 95 tone and the 64-ton p in shide in which the gun moves back during recoil. In his fraulte recoil between the counter recoil mechanism are attached to the gun slide. The ontire unit consisting of grediers and the counter recoil mechanism are attached to the gun slide. The outre unit consisting of grediers and the counter recoil and the counter recoil of all the counter of t into a single unit 72 feet long and wighing 68 tons it and the foundation adjusted unt I tle entire weight of

the gun car is carried by it
Aiming is accomplished when firing from the rails by

the use of a curved track A simple traversing gear is provided to enable the gun to be samed when it is on the pit foundation

the pit foundation
Pvry item went forward exactly as planned. Construction was pushed to the limit and all speed records were broken. In he inst mount was completed on April 28th 1918—just 7.2 days from the date the contract was signed 120 days from the date the designs were first started. Thus mount was proved at Sandy Hook N J on April 30th 1918, where it met every test most successfully. June 1st 1918 saw the complete fulfilment of the first phase of the project—the Naval Railway Batteries were ready for shipment

A slight delay occurred in the shipment of the batteries to France for the German submarine U 151 which was orerating off our ceast seemed to be especially anxious to prevent the shipment of the material submarine danger however was soon overcome, and by July 4th 1918 practically all the material was en route to it Nazaire I ran e where an creeting gang of American Blue sackets was eagerly waiting to put the guns together and get them into action. The French too, together and get them into action were just as eager to get the guns into action so work on the assembly of gun ears No 1 and No 2 and their trains was rushed and they left for the front on August 17th and 18th respectively

After a short trail trip over the railroads of France, and some preliminary tests those guns were rushed to Laon where under the direction of the 10th French Army they had their hirst shots against the Germans on September 6th 1918—nine months and ten days from the date on which work was started

the date on which work was suaried.

At I son the guns inflicted great damage their crowning achievement being the destruction of a crowded German moving ricture theater. One 1 400-pound Scrman moving picture theater One 1 400-pound shell hit the theater leaving nothing but a deep crater in the ground marked by scattered debris and identifica-

tion tags of former occupants of the building

Gun trains No 3 No 4 and No 5 and the staff train,

World Markets for American Manufactures

Educal by LYNN W MEEKINS

A department devoted to the extension of American trade in foreign lands

Far Eastern Demand for Motor Cars

THE man who drives in automobile through such striction from the such that the interaction is of boar striction. New York and I flings has faith to worry him compared with the spenter of a motor vehicle in the compared with the perater of a motor value in of the Orent such a automobile exporting recently. In China and in Lapan the good reads are practically limited to the large cities where there is no he amost of allow moving vehicles and pedestinus that it is hard work. sometimes to jass a small. Although the rural visitor to New York may jump helf way out of his shoes when the piercing sound of a motor horn strikes his car the resident of loke pays no attention to such sounds - he

has the right of way preferred chafty because the Japanese lady doesn't wear a hat. Her hair has been painstakingly combed and she shuns a breeze Other features favoring the closed on a lokio are the clouds of dust in or Not that open cars have no lies meet the demand for country travel and are popular with the foreign residents

With more than \$1 250 000 000 capital invested the American automobile in-dustry is second only to steel in the manufacturing field 1 xport business is vitally necessary for its continued prosperity, and there is a steedy mereuse in the number of motor companies entering foreign fields One of the best known manufacturers in

this line is conducting a seminific siles
campaign this is planting his products in
the world's in set productable markets. He
is sending high-salibered representatives to make
systematic studies of the nocks of his prospective customers. Hose men as supplied before they leave the
United States with all the information that is obtainable
The state of the state of the state of the state of second They start out with a fur knowledge of general conditions in the countries to be visited, with particular emphasis upon road systems, fuel costs and the purchasing power of the people lile motor vehicle has to have something more than a footpath to travel over, gasoline or an equally efficient fuel, to keep it going, and a regular expenditure to maintain it

Where Faverable Conditions Prevail

Good roads and prosperity usually go together in the Orient as well as in other parts of the world They are found espossally in the Philip pines the Straits 'etitlements, the I ed-crated Malay 'tates and the Dutch Least erated Malay States and the Dutch East Indies Last year the Philipumes enjoyed the largest trade in their history. The natures are the principal buctrs of motor cars and they prefer small, lower-preed machines. In Manils most of the estab-ishments that used to keep horses and valueles for hirr, now maintain motor cars for real by the hour. A motor bus line for reat by the hour A motor bus line is projected and if fuel costs do not decrease the company operating these busses will import gasoline from the United States in its own sailing vessels

There are more than 3 000 miles of improved roads in the Strats Settlements and in the Federated Malay States. This region is well off financially because its raw materials-mainly rubber and tin were needed for war purposes, and they are also important in time of peace Purchasers of automobiles (and this state-

rurements of automornes (and cus state-ment applies equally to buyers in the Dutch Fast Indies) are interested in cars of the better grades - Freight rates to these countries are high and the man who buys an automobile thinks are high and the man who buys an automobile thinks he might as will have a good one, because a considerable part of his investment is spent on transporting the machine from the United States

Manils is a good distributing point not only for the Philippines but for much of the Orient The manufacturer introducing his car into Malaysia should conentrate his efforts in Singapore Batavia and Sora-baya are the principal ports of entry in the Dutch East Indies The motor car business in other Far Eastern countries is centered in Shanghai for China, Tokio for

"A MERICAN manufactures of office equipment A have firmly established themselves in the Argenteen market, writes an American representative from Buenos Arres "They have the reputation of designing the most practical and the most efficient and such as a sive that is so well liked, in the var preceding the war, Argentine spart at Beat 3750 000 for American Office furniture and for chash to be used in thesters and

be seld. The education of Argentina office assistants in this intelligent toes of modern time- and inbor-saving derivings will largely increase the sales of American correspondence files and card index systems, which already have been reconstully introduced. If manufacturers of American office furniture swoidle equip free otherspectures of American office furniture should equip free otherspectures of American office furnitures and the control of the second of

Sectional bookcases are good sellers in Sectional bookcases are good sellers in Argentina I is important that the bettom section should be provided with wooden doors to conceal the paper covered books, which become ragged and solled from constant use. The size desired for this section is a depth of from 16 to 18 inches and a similar height.

Because at present price counts more heavily than quarty in Argentine, the sale of steel office furnature will be some-what restricted. Although prices are very high, there seems to be a continual demand for steel files and eard index cases. A or steel nies and eard index cases well-directed campaign should place in railway offices, hanks, commercial houses, ad Government buildings the modern equip-

hibraries, and Governmen ment that they now lack

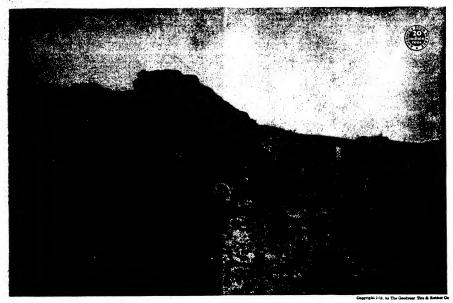

How to Ingress Our Sales

"The American furniture manufacturer must keep three things in mind if he wishes to build up a prediable business in Argontian," and a vasitor from Reserio "He should standardise equipment, making fewer changes in dimensions and styles Borne time ago, I bought some correspondence files with the understanding that more of the same kind were obtainable standing that more of the same kind were obtainable when desired Naturally it was considerably annoying to be told later that a newer style had replaced the variety that I had bought The lack of uniformity in color limits the sale of American furniture

color limits the sale of American furriture. The golden quartered-oak finsh is the most popular in Argentina, and all kinds of office equipment should be in the same shade of that color. It is sometimes difficult to match deals and chairs with bookeases and other equipment. Your nanufactures should settle upon definite styles of golden eak, light or dark.

BOSTON to BOSTON Via San Francisco and Los Angeles

TWO Goodyear motor trucks, shod with Goodyear Pneumatic Cord Truck Tires, recently carried full loads from Boston to San Francisco and returned to Boston by way of Los Angeles.

They were taken off their regular Akron-to-Boston route without special preparation and sent west.

As shown by the recordograph, they completed the 7,763-mile round trip

in 24 days, 1 hour and 55 minutes of actual running.

The journey constituted a remarkable demonstration of the ability of motor trucks, equipped with Goodyear Pneumatic Cord Truck Tires, to account the worst kinds of going found anywhere.

For 71.5 per cent of this transcontinental jaunt was made over unimproved roads and in wagon trails.

The traction of the big Goodyear Pneumatics enabled the heavy trucks to negotiate mud, sand and grades that would have stalled solid tires.

This memorable performance of these pioneering Goodyear Pneumatic Cord Truck Tires points to their immense advantages for both highway hauling and off-the-road work.

Making the most of the bicycle during winter months

When the Bicycle Becomes an Ice-Boat

WHY leave the bicycle idle in the VV cellar during the winter months?
When the roads are covered with snow the bicycle can be turned into a temporary ice boat and used on frozen bonds and rivers At least that is what occurred to a Brooklynite and he set to work to prove

The bicycle can be readily converted into a serviceable ice-boat hy removing the front wheel and using in its place some form of frame resting on a pair of skates In this case the Brooklynite arranged the frame with two small seats so that he cou'd ride about with two youngsters for company s sake Using a non-skid tire on the roar wheel it is possible to attain considerable speed with a vehicle of this kind and in the absence of a non-skid tire, a bit of adhesive tape at regular intervals along the tire serves the purpose

A Saw That Is Different

THF saw herewith illustrated, and recently placed on the market by a Newark manufacturer consists of two steel arms actuated by a powerful connecting spring and crossing at the other end through a slide Brackets are fastened to each of the flat ends to which the blades (or plain pressure bars) are attached These brackets are so made that the blades can be fitted with terth in or with teeth out and at any place on the flat end of the frame Accordingly the outfit is extraordinarily flexible and can be adjusted with great exactness to the particular size and position of the tree or lumber to be cut Iwo blades can be used cutting against one another like used cutting against one another like the blades of a pair of scissors er a single blade opposed by a plain pressure bar, as illustrated

When starting the blades, or blade and bar, are spread against the resistance of the spring, so as to straddlo the tree er the spring, so as to assume the spring, so as to assume the property of the product of the second product and for the concessive product of the second product of the product of the second product pr

The great advantage claimed for this outfit is not alone in the great decrease of elbow grease which it requires—a decrosses so great that a child can out the heaviest trees or timbers according to is t be considered the great convenience of being able to apply the saw wherev destred One can steep over and cut a tree flush with the ground one can insert the blade under a prostrate log and cut the latter regardless of its position one can stand on a limb and sever another limb above or below in fact the saw can be used in all sorts of places where it would not be possible to employ the ordinary cross cut blade Government tests indicate that one man with this saw ean work to hetter effect than two men with the ordinary cross-cut saw

A Decorticating Machine for Flaz

EXPERTS in the preparation of flax have recently had their attention drawn to an invention of Mr A L Spalding of Dundee Scotland, which, according to the claims made for it, can according to the claims made for it, can perform in a five hours all the processes of preparation from the time the flax is pulled from the ground until it is in a state for naufacture The si, infeance of these cause is made sufficiently clear by the s atoment that under present technique this preparation consume weeks of time and a great volume of labor

For centuries scientists and mechanics have been experimenting in the effort to simplify and improve the process of retting but progress has been so slow that if Pliny were to return he would recognize present methods as substantially identical with those described by him as employed by the L_b p(tans the flax magnates of his day Alter the rippling comes the steeping the plant being placed in a large receptable filled with water and covered receptace filled with water and covered with straw and stones A fermentation is here set up, requiring the nicest care to avoid over-or under retting Then the flax is taken cut and dried, broken, soutched and hackled

All this requires from two to four weeks.

But by the Spalding pro-cess the reeds are taken from the field and put directly through the de directly through the decor-ticating machine which takes off the seed and prepares the shove The material is then scutched, the gum extracted and it is ready for manufacture It is said that the whole proess consumes fewer hours than the present one does weeks in add tion, Mr Spaling claims that his process would save an enormeus quantity of straw which is now burned or put back in the ground, as well as of gum and shoves which at present are obtained only in a very unworkable state or put back in the ground

Dun lee experts who have examined the apparatus and tested the ma terial which it turns out are very favorably impressed by the results and

pressed by the results and some maintain that if properly developed, the machine should revolutionise the whole flax industry Others, while freely conceding the value of the processes which have been discovered here, are in doubt as to their success on a practical com-mercial scale in any event, the future development of the invention will be watched with the greatest of interest

AT the mention of periscopes one AT the mention of periodoges one another war article Periscopes are generally associated with military or naval warfare But in this case the periscope is far removed from warfare, this is a story of a little ingenuity applied to usic and the theater Herbert L Hyde, composer and mem-

ber of the Chicago Symphony Orchestra, came to New York city some time ago to rect his own music at the premiers of

Orchestra leader following the movements of the players by means of a periscope

two well-known plays. To his diamay, however, it was discovered that the orchestra pit in the theater was under the stage yet the domands of one of the plays—a pantomine—required that Mr Hyde watch the stage and direct his orchestra so that the music would syn-chronise exactly with the movements of the actors
The difficulty was finally solved by the

use of a tranch periscope, permitting Mr Hyde to follow the movements of the players from his director's seat under the players from his director's seat under the stage. The periscope shown is an exact copy of the historic one which Capt Bairnsfather supplied for his soldier musical comedy, 'The Better 'Ole."

Recent Patent Decisions

Operativeness —A prior patent for a machine although the machine may not be practically operative, may operate as a prior publication, which will invalidate a subsequent patent to another, which embodies the same principle in an oper-ative machine There is a presumption from the grant of separate letters patent for two improvements on the prior art, but there is a specific difference between but there is a sponific difference between the inventions. As against complainant in an infringement suit, the presumption of utility of the machine of a prior patient is greatly strengthened by the fact that complainant for many years represented it to be useful, and the machine of a matter than the property of the property of the pro-sumer strength of the property of the pro-sumer strength of the pro-

All Smoking Tobaccos are Flavored

"Your Nose Knows"

The Encyclopaedia Britannica says about the manufacture of smoking tobacco, "... on the Continent and in America certain 'sauces' are employed... the use of the 'sauces' is to improve the flavour and burning qualities of the leaves." Your smoke-enjoyment depends as much upon the Quality and kind of flavoring used as upon the Quality and aging of the tobacco. Tuxedo tobacco uses the purest, most wholesome and delicious of all flavorings—chocolate! That flavoring, added to the finest of carefully aged and blended burley tobacco, produces Tuxedo—the perfect tobacco—"Your Nose Knows."

Try This Test: Rub a little Tuxedo briskly in the palm of your hand to bring out its full aroma. Then smell it deep—its delicious, pure fragrance will convince you. Try this test with any other tobacco and we will let Tuxedo stand or fall on your judgment—"Your Nose Knows."

How One Man Carried the Bond Issue

A well known county engineer tells this story, and it s the best good roads story we ever heard

He says the county was in terrible need of better roads The mud all through the district was so deep that it was impossible to use wagons, all traveling being done either on foot or horseback

In spite of the need there was little enthusi asm for good roads when the Board of County Commissioners met Everyone was afraid of the presumed high cost and increased taxes

A farmer in the back of the room arose

Mr Chairman he said I ain t fit to aldress a lignified meeting like this, but that's because I ve halt travel for ten miles over the kind of r 1 is you give us

I c ul in t drive I hal to ride horseback

My boots are covered with mud, my

trousers are covered with mud, my coat is covered with mud, my hat is covered with mud, and if I hadn't stopped to wash it my face would be covered with mud, too

I look as if I had crawled here on my hands and knees, and I m only half through because I ve still got to go back, with five dollurs worth of groceries that I bought from brother Fletcher

If there had been a good, hard road that my old horse could climb up and draw in a load of lumber that I ve got ready, I would have bought twenty-five dollars worth of groceries instead of five dollars worth, and there would have been that much more money in town tonight

And the mud-covered farmer sat down!

Other speakers took up his case They pointed out that good roads were an asset instead of a liability, an economy instead of

an expense, that they brought money into a town and greatly increased the markets.

The result was that the Commissioners enthus a stically passed a resolution to issue bonds enough to give them several miles of good roads.

Today the county is more prosperous than ever, school conditions are better and the amount of traffic going in and out of the town has increased several hundred per cent

The old time hostility to good roads by taxpayers is fast passing away Mud holes may look cheap, but they are the costlest thing any community can have around.

If you will build and maintain your roads with Tarvia you will have dustiess, mudless, frost-proof highways that cost little to construct and maintain

Tarvia has removed the last obstacle to the Good Roads Movement because its use insures good roads at low cost

The Three Big Profits From Good Light

SCORES of careful tests covering a wide range of industry have determined certain definite advantages of correct illumination over the incorrect. Expressed in percentages, proper light means 12% more production; 25% less spoilage; 25% fewer accidents.

The Electrical World recently said, "That good lighting helps to build up esprit de corps seems undebatable. The men are happier, take more pride in their work and in the appearance of the shop, and generally do better all around when the light is good "

One Government Act Tells the GMC War Story

One Official act of the United States Government tells in the simplest way the outstanding story of GMC trucks in war

When the War Department sought to solve the problems growing out of too many models in motor transport standardized truck sizes resulted

Where no commercial model could be found to fit the exacting requirements government specifications supplied the lack

When it came to the 3/4 1 ton truck there was a commercial chassis ready built

It was the GMC Model 16

It had already been proved in ambulance service on the Mexican Border

It had served the Allies ably in ambulance work before the United States entered the war and was selected by the Medical Department in anticipation of the United States joining the Allies Thousands were subsequently purchased for ambulance service

Later in the war when the Government decided to select a truck chassis to be adopted as Class "AA"

for all military purposes this GMC Model 16, strictly on its ments in competitive tests, in the hands of Government officials and subjected to the most exacting trials, made a perfect score, and it became the official Government standard—picked as it stood

Because of the enormous Government demand our production on this model had reached the point at the close of the war which now enables us, by continuing full speed ahead, to offer the trade this same model at our pre-war price of \$1,495, a reduction of \$250.

This is the truck that made good in France, Beigium and Italy in the days of battle, and it will continue to make good in peaceful pursuits

This history-making Model 16 is but one of six good trucks built in the GMC factory, every one of which has equally as good a record—even though less spectacular—in more than two hundred lines of business—prices reduced on all models.

### The Peace Conference and the Submarine

I IER much careful consideration of the subject A we published on December 7th an Octavited Abolish the Submarine To those ontified Abolish the Scientific American who have been familiar with the Scientific American it will be un terstood that this call for prohibiting the c reir 1 tim of this type of warship was consistent with om stitude to the submarine for many years past I rom the very first we believed that the fact that the submarine was both blind and sluggish and must in all profability ever remain so would prevent it from becoming a serious weapon of war against up-to-date and well found ships that fight upon the surface of the sea Despite the earn at and long continued effort to remedy these two grave and inherent defects the submarin remains today pretty nearly as sluggish and blind as it was ten to fifteen years go Moreover there is no promise that these defects can be eradicated and until the submarine in the submerged condition (which is its fighting condition) can steam twice as fast as it can today and unless it can see its target with practically uninterrupted vision it must continue to be a failure as a fighting weapon

The great day of tual-the war which was to prove the deadly efficiency of this untried weapon-has come and gone with the result that the submarine as a weapon gitimate war between fighting ships is discredited Furthermore its sile weapon its very raison detre the torpedo to carry which within point-blank range of the enemy it was designed and built has by no means come out of this war with flying colors Even the fast surface boats like cruisers and destroyers with all their ad vantage of speed cl ar vision of the enemy, and ability to mancuver with ramility have failed to get results with the torped ; that incasure up to the great expects tions which were based upon this weapon in pre-wai A notable metan e of this was the cruiser fight in the Bight of Heligolan I cirly in the war when no less than sixty ships all carrying the torpe to fought a furnish action for over helf a day in the course of which somes of turn do s w re fir d without recording a single hit The ships that were sent to the bottom were put down by gun fire

Sy that if the Prace Conference or the League of Nations contains as we are teld it probably will a clause atting an embargo upon the construction and use of the submarim. the science and art of naval design and construction will suffer no serious loss.

On the other hand the peace and security of the world will make an immeasurable gain. The German navy departing from te legitimate held seared upon the submarine as one of its main instruments of terrorism and carried on a campaign of pracy which in the agree to come will be written down and renumbered as the one great German contribution to the traditions of the sea. In doing this she inredictally and very dra-

matically revealed to the world the frightful menace to its security which lies hidden in this most effective wapon of piracy Hence the growing relaxation of the fact both in America and Europe that since the submarne as of doubtful value as a weapon of war, it should be abolished sitegether and the ban of crillisation set upon it once and for all.

We are well aware that in times past it has been fashionable to speak of the subcarame as the weapon of defense and therefore, the felse weapon of the small and weak nations. But we believe there is a consensus of opinion among naval men that the subnarian alone can afford no adequate protection to a coastline against attack by a nary which has a powerful and well-balanced fleet of surface vessels. Admiral Rodman has given us a graphic decemption of the way in which has battle equadron was wont to go out into the North Sea and pair i) in watern that were infected with the subnarians. Not only did his American battleships pass through thrown months of such service without being torpedoed but the capital ships of the whole Grand Fleet we understand suffered a smaller immunity.

If as dispatches from Para seem to indicate the lead in nations ourselves included are, going 1 makes a great reduction in the naval armaments the ples for putting in the bain upon the submarine, be mee of particular importance. For if a nation taking advantage of the particular importance. For if a nation taking advantage of the build a number of submarines far boyond its allotted quots at might preceptate a raid upon the world a more shant flosts under conditions which would give far greater promise of success than those which confronted Germany. It was the size of the Allied flosts and their great alup-building resources which enabled them to build up a vast anti submarine flost in time to meet and master the sudding energence.

And let us never forget that Germany came within an ace of accomplishing her object

### Public Interest in Automobiles

THE decided success of the double automobile show held in New York this week and last us the very best of evidence that ur motor car industries are rapidly coming back to a pose to base. Scarcely another industry was so uper by the war. Although work on motor trucks was intensified by government orders passenger car building was virtually inrught to a standard to provide for the construction of surplanes and other war machinery.

A few months ago drastic restrictions were placed even on the use of pleasure vehicles owing to the neossity of conserving gasoline, and quite naturally all
thought of holding the outstomery annual automobile
show in January this year was abandoned. Even
stee the againg of the armstore it seemed hardly
advasable to revive the show. But the removal of war
restrictions was attended with a remarkable restriction
and with commendable enterprise the National Automobile Dealers. Association votured to stage a belated
automobile show. The response was immediate and
enthusiatic. The old Maddon Square Gardes which
a few years ago was ample enough to hold the exhibits,
soon proved entruly too small for the large number of
manufacturers who wished to dusplay their products, and it
was necessary to use the adjlessor of Armson drawory.

The wisdom of having an automobile show this year is attested by the large and enthusiastic throngs of visitors to the passenger show last week It seems certain that the commercial vehicle show which will be drawing to a close as this is published will be proportionately as great a success.

There was not much in the passenger exhibits that was broadly new, but in matters of detail there were many developments which showed that the progressiveness of automobile manufacturers was not halted by the restrictions of the war.

The most ancouraging feature of the show, however, was the hearty undorsement given it by the guarral public. Motor vehicles hold an undying popular interest A remarkable reaction from the restrictions of the war is shown in the automobile registrations which came to a total on January int 1919 of 364.5422 as against 4 941,376 on January 1st 1918 an increase of close to twenty per sent With such hearty public support there is little to fear for the future of the automobile nuture.

### 'Alcohors and Antennabile

UGGESTIONS have been this that the egustless acquired in the building end operation of shiptime acquired during the west likely maximized beautiful dealing of the state of th

The airplane aggine, owing to its ownerhead valves gase and its relatively loose fitting, is desidedly noisy—a condition which makes it undestrable for automobile use The airplane engine, to save weight, has a lights stank-start of high-class, expensive steel. Under fall power this vibrates, whereas in the automobile tengine it is found advisable to employ a heavier and either shart, in order to minimize vibration. In other woods, it is moden to make much difference whether as attributes assigned barks and vibrates, so it is made noisy and vibrating in order to gain other advantages which de make a difference. But the automobile engine must neither better one shiver, and has to be built with this fact it mind

Agan there is the question of speed. Everybody, know that an airplane engine is much faster than an automobile engine, everybody perhaps dees not realise what a fundamental difference in construction this involves. Thus, carbureton in the strykene engine is such as to afford a very limited degree of Sentiality, while the ground engine must mix the fud property for a wind range of speeds. Moreover, the sirplane engine needs to develop full power at one speed only, while the driver of a car expects has engine to deliver full torque at any speed and without vibration. The shart of the arriplane engine turns at about half the speed shown by that of the automobile engine, making the two quite different as a mechanical proposition.

Nor a speed the only particular in which operation offers on land as against in the air. To adapties angine a slaw of the order on land as against in the air. To adapties angine a slaway supplied with a light, volutile feet alleving achieves and a tevation of 15,000 feet when the conpression area is reduced 40 per cent, the automobile is apposed to handle lower grades of foul withster trouble, and in this regard must always do better in the future than in the past—for high grade gasdines give seasons werey year. Then the airplane engine is treated like a sick baby, getting the most expect attention at frequent intervals. The automobile engine, on the other hand, as usually handled by one who is not a good mechanis, and under all kinds of treatment is expected to musmorbhy for long periods without attention. In addition to this general condition, there is the specific fact that the airplane engine usually operates in a dute-free atmosphere while the automobile is exposed to vast quantities of dust and dirt.

Without becoming too technical for the lay reader, perhaps we can point out that the airplane engine, in order to meet the demand for minimum, weight, is usually provided with steel cylinders, with jackets welded on. This construction is expensive, further, it takes up more heapt than can be devoted to the cylinders in an automobile. Here we have another instance of sacrificong something that doesn't count—height—for something that doesn't count—the thing that dash't count in the plane does count in the automobile.

Two these brief remarks it is plain that for the best results each type of tengins should be considered as a separate problem, and should be so treated as best to adapt at to the conditions which it must meet. There as no advantage to be derived from sying to use she one in place of the other Manufacture of sirplane suppose in place of the other Manufacture of sirplane suppose than the west best of the sirplane of the contrality many automobile shops, beyond quission Further than this we should healthest to go in drawing lessons from the surplane development of the war for application to the automobile

OUR subscribers are requested to note the empiration date that appears on the wrapper of Southwayse Assentant. If they will send in their received orders at least two weeks prior to the date of expiration, it will aid us greatly in rendering them efficient sevence.

### Dectricity

Impurese Radio Talephone Progress.—An exchange to amount witness and was telephones was established in Rada, Agaza, about the first of the year by the Government Department of Communication, state Wardess (April 62 speech lesses A windows tower 180 feet high is now shong second in front of the largest of the Kobe shappings within a suit of the largest of the Kobe shappings within a state of the largest of the Kobe shappings within a state of the largest of the Kobe shappings within a state of the largest of the Kobe shappings within a state of the largest of the Kobe shapping within a state of the largest of the Kobe shapping within a state of the largest of the Kobe shapping within a state of the largest of the Kobe shapping within a state of the largest of the Kobe shapping within a state of the largest of the largest of the largest of the Kobe shapping within a state of the largest of the l

New York's Folice Wireless.—Acting police commissioner of New York recovered on Decomber 5th last a report of the work done by the wareless telegraph branch of the police department during the past two years. The wireless tower is on the roof of the police head-quarteen building, and the seasons end of the source is shousd the police boat 'Patrol,' which covers the harbor and rurser which bound New York The report shows that merchanduse valued at upwards of \$400,000 and some twenty-five lives have been saved manily through information received by wireless. About \$2,000 messages have been handled by the service Head-quarters has been able to receive messages from a discussion of 1,500 miles, and to transmit them 300 miles

A New Form of Variable Electric Resistance—A recent Germas patent taken on thy L Straser relates to a modification of the type of resatance in which an uron wire enclosed in hydrogen is surrounded by a heating coil. As is will known, a small change in the current flowing through the heating coil can be made to cause a very considerable change of resistances in the iron and such resistances are claimed to have sperial applications for use with machines of very variable speed. The newlify embodied in the patent consists in making the beating coil of a material with a negative temperature coefficient. In this way, continues The Electricion, the beating coil of a material with a negative temperature coefficient. In this way, continues The Electricion, the beating coil can be caused to bring about a much greater change in the from wire resustance, and the sensitiveness of the apparatus is accordingly increased.

Preventing Electrolysis Damage -Various methods of preventing damage by electrolysis to gas and water systems, lead-covered cables, and other metallic subsurface structures are explained in a bulletin announced by the Bureau of Standards Department of Commerce Damage of this kind is caused by stray currents from street radways and is a constant source of worry and some in the larger cities It is said that no complotely satisfactory method of preventing damage by electrolysis has been devised, but the investigations upon which the report of the Bureau is based indicate the m effective methods of dealing with the problem etin is the second edition of "Electrolysis and Its Mitigation," No 52 of the Technological Papers of the au of Standards It is one of a series that is being Bure immed on this subject. Copies may be purchased at 36 cents from the Superintendent of Documente, Government Printing Office, Washington, D C

Renorating Discolored Arc Lamp Globses—At the present time, when are lamp globes in the United Stabes cost about \$2 each, the problem of cleaning up those which have become dirty and discolored with use is worth mentioning. The magnetic arc, with which soul gibbs are largely employed, is apt to give off a metal full which gradually accomulates in the interior of the globs. This deposit on he cleaned off without much trouble with a hittle muristic send. A more serious maker is the discoloration which commonly takes place in globes containing traces of manganese, under the section of light. This discoloration which commonly takes place in globes containing traces of manganese, under the section of the This discoloration is not merely superficial, but extends into the interior of the glass and campit, therefore, be removed by souring. Mr A Hers, in an article in the Electrical World, describes a process of baking such globes at a suitable temperature in ovens whereby, it is atsated, the discoloration is completely removed in the course of about 24 hours. As the entire process, including removal of deposits, cost of gas or more of the section of gas or sected will retain their transparency sufficiently for about 75 per cent of the time during michael and the section of the discoloration being removed by lists the fast of this discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by lists the section of the discoloration being removed by

### Astronomy

A Halium Star with Larje Faralias —Star of the belium type (Type Ho the Harvard system) are usually characterized by small paraliax small proper motion and low radial velocity. A notable exception has been found by J Volte, observing in South Africa in the case of the star Bosn P G C 1517, in Columba for which his photographic measurements give a paraliax of +0.009 sec ±0.000 He also gets for this star the relatively large proper motion of +0.235 sec while R E Wilson, of the D O Mills observatory has determined its radial velocity to be Sa kilometers per second

Messurements of Southern Double Strar—Anotable collection of double star measurements, by Bernhard H. Dawson, has recently been published by the observatory of La Pieta the only observatory in the southern hemsphers, with the exception of that at Johannsburg, regularly capaged in measurements of that kind Mr Dawson's measurements extend from 8 deel 42 degrees southward and eventually the work will be extended to the south pole. The stars were selected mainly from the last of Srr John Herschel sdame-overies at the Cape of (mod Hope The number of Herschel pairs remeasured in this undertaking was 985 and the total number of pairs measured 1,305 and the total number of pairs measured.

Astronomy in British Schools —A committee appointed by the British Astronomical Association to consider plans for furthering the teaching of the elementary facts of astronomy in schools has made a report recommending among other things that the Association appoint a standing committee on this sub-Its functions will be to give aid and advice to teachers in regard to astronomy to draw up suggested courses of instruction to provide lectures for schools, and to keep track generally of the interests of the science in the British od national system tronomer royal Sir Frank Dyson made the elementary teaching of astronomy the subject of his presidential address at the last annual meeting of the Association From this address it appears that the public of Great Britain is quite as deheient in astronomical knowledge as our own He stated that in showing visitors over the Royal Observatory he had frequently pointed out a photograph of the Orion nebula and asked them whether they knew the constellation of Onon The answer was generally in the negative! The speaker expressed the opinion, which we believe is true in America as well as Great Britain that in spite of the spread of general education, the knowledge of the elementary facts of astronomy is less widely diffused than it used to be The use of 'the globes' a regular feature of the oldfashioned curriculum, seems to have a seed out lerres trial and celestial globes a simple orrer; and a small telescope should be included in the equipment of every

The Death of Prof Edward C Pickering deprives America of one who probably ranked as her foremost astronomer and takes from Harvard the second in semonty among her active professors. During his 42 years of service in Cambridge the Harvard Observatory has quadrupled its capital and income and increased in sater ratio its influence in organised astronomy It was largely through Professor Pickering's initiative that the system was built up whereby Harvard kept in correspondence with observatories and private tronomers all over the world to the great benefit f all in the resultant opportunity for comparing and verifying observations and computations. In addition to this he was always a leader in astronomical photogr phy and in the study of stellar light and stellar spe tra Some idea of the scope of his work in these directives is to be had from the statement that during his re od of superintendency the Harvard Observator, has effected nearly a million and a half direct measure sents of the light of stars Part of this work has consisted in a painstaking following of all known variables of sufficient range to make their study worth while so that the Harvard collection of data and photographs is the standard to which all questions bearing upon this important class of stars are referred. The influence of Professor Pickering's guiding hand will be the less missed in that he leaves a competent organisation behind him but his loss is one that American astronomy will long feel. He possessed in the last degree that combination of scientific and administrative ability which is as rare as it is valuable

### Industrial Efficiency

Additions to Department of Commerce of the important organizations in the War Industries Board are, by direction of the President to be turned over to the Department of Commerce These are the Resources and Conversion Section the activities of which will be continued only temporarily and the Conservation Division which will ermanently in the Department of Commerce The Conservation Division of the Wat Industries Board was at first known as the Commer tal Leonomy Board and its function has been the studious conservation of resources and facilities by scientific commercial, and industrial economics The material gathered and the staff developed will on this the Department of Commerce to carry on the work of chiminating waste and promoting precision in business which it has long had in mind

The Price of Raw Materials -We must guard ourselves against motives of fear in the business world states Burwell 8 Cutler Chief of the Bureau of Forcign and Domestic Commerce in a rocent address before the Southern Commercial Congress at Baltimore At present most of our factories and storcrooms are filled with raw materials and commodities which the owners may be tempted to sell at sacrifice prices in order to restore cash balances wholly depleted by war taxes and purchase of Liberty Bonds Precipitate action of this kind if based on a fear that raw materials will generally decline in value will bring individual and national loss The most knowing and deliberate business men realise that the available supply of basic materials for human use and consumption is many times has than the world will need for some years to come. This is the inevitable result of four years of systematic destruction without replenishment in every quarter of the globe

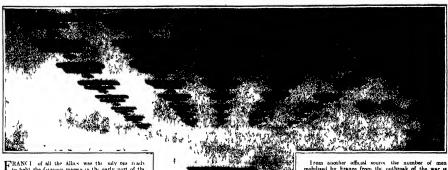

Danger in Next Four Months — The great danger in the coming four months is that there won the jobs enough to go around that unemployment will come with attendant misery and social unrest at a time when anarchistic tendencies are contagous. Let us hope that this situation will not arise but let us quard against it stated Mr Smith at the ricent I alor Reconstruction Conference. The remedy of building public works in and variable to large scale until spring. he continued

The farms will not call urgently for men till frost thaws
out. Building can not for a season be remund to any
great extant. Unefly must we look to our manufacturers
to carry the hurden. But they are bentant. Taxes are
not yet determined. The cost of money is high and
eredit tund for a while. The present or they makeral and
labor are high. The producer hope a that they will fail
and manufacts at undem y to wait till they do. To meet
only of these determent features as an immediate mational

Careless America -According to statistics compiled by the Pulice Department of the City of New York approximately 25 000 persons were injured by automobiles and motor trucks in the streets of Greater New York during 1917 Other cities as well have large lists of automobile accidents in proportion to their populations The strict enforcement of traffic codes and police supervision of the use of streets and highways have undoubtedly, tended to keep down the toll of traffic accidents considerably in some sections but it is plainly apparent that public officials can accomplish but little in accident prevention without intelligent conjugation on the part of the general public and this is largely a matter of educating individuals who comprise the general public to a keener sense of their responsibilities in the matter In an attempt to direct public attention to the enormous loss of life and etherency due to automobile accidents in the United States Mr H S Firestone president of a large tire company has enlisted services of a leading film company to produce an eduentional film entitled Carcless America Various types of automobile accidents are vividly presented on the screen and shown to be due to the care lessness alike of drivers and pedestrians The scenes are most realistic and thrilling N less than nine automobiles are said to have been destroyed in producing the sensational scenes of accidents due to recklessness Through the courtesy of Mr Firestone this film is now being shown without charge in villages towns and cities throughout the United States as an added feature of the regular programs of motion-picture theatres and local enter-

### France's Rôle in the World War

What Our Sister Republic Paid in Life and Treasure Toward the Victory of the Allies, as Told by the Official Figures

Practice of all the allies was the only one read to high the German masses in the early part of the war. This was due to her geographical location and sliso to historical circumstances. The close proximity of the threatning, German I hughry and the recollection of the proceeding was of 1870 71 had made her prepare her armies to defend I reach soil against a Cerman enslaught which was constantly expected
Therefore France's rôle in the common action

gain time while her allies organized and trained their armies the French soldier stood firm while waiting armies the french some room irm while wanted first for the divisions of the British Finjire and then for those of the United States. The victory could not have been won had I rance been unable to hold the line while Lord Kitchener; and later General Pershing were getting their troops in line

As time was working for the Alles those virtues which re commonly said to be characteristically French dash and galantry were no longer sufficient. In such a war patience perseverence and unity were required by the French people who have often been marepresented and believed incapable of a istanic t effort. But since August 1914 facts have sudeed spoken for themselves

Everybody knows how formedable was the flood of

men and artillery pouring through Belgium and Northern mera and actuarry printing unrough needing and Arothorn France after the unsure-solul attack of the I reach in Alsace during August 1814. The mass hurded against the Frunch compared of a but 1 500 000 men with 4 000 field guns 460 batteries of heavy guns and 700 enormous merater. The mass was a second to the compared mortars. This mass was stopped between Paris and Verdun, in the region of the Marne from the 6th to the 12th of September 1914, by the I reach armies of General Joffre with the help of the seven gallant divisions of Field Marshal French I hen after the rush to the see in the effort of each side to outflank the other the new drive of the German army toward Ypres and Calais from the 23d of October to the 11th of November was stopped by the divisions of General Sir Douglas Haig reinforced by the French army corps brought up by Ceneral Foch

Then began the long watch from the North Ses to Switzerland while Lord Kitchener was silently prepuring his armies of volunteers Attacks were delivered on the 9th of May near Arras and on the 25th of September 1915 near Arres and in Champagne by Ireach and British troops in or ler to lelp Russia who was fighting desperately against Corrunation unlaughts. When the Crown Prince attempted to destroy the Iranels at Vordun from Irburary to July 1916 before the British armes could come into line in large numbers he met with armines could come into the mark influences in each way as a vistorious resistance which as Lloyd Coorge has said will ever be imprishable. Verdan savid not only France but the great cause of all the Allies. Because of the battle of Virdan the drive on the Somme during the second part of 1916 was possible the new armies of Kitchener with supporting French troops almost compelling the (mrman army to effect a general withdrawal

In 1917 while successes were being won in the various attacks delivered by the French—the Aisne April 16th and May 5th Verdun August 4th the Aisne October 23d, and in Flanders - the British were gloriously attack ing in many drives between St Quentin and Ypres
At last, in 1918, the French aided the British in

In 1918 the French Army had 40 airplanes to each one in 1914

rapelling the big German offensive of March 21st The order was Stand firm the Yanks are coming A order was Stand firm the Yanks are coming A I reuch commander—Foch—was made generalisamo of all the Alhed armies No one in France lost hope in the ultimate fate of the Republic and her armies al though those days were of the blackest with the Germans advancing over wide expanses of French soil Likewise on the 27th of May Paris was saved by the desperate resistance of the French aided by the heroic troops of resusance of the French aided by the heroic troops of Haig and Pershing. Every fighter knew that more and more American divisions were landing and that victory would belong to the army that could hold out the last 15 minutes After the failure of the German drive of July 15th French and Americans began the victorious rush forward which was to result in the common victory of the Allies and the armistace of November 11th

that was France s share on the Western front richest most thickly populated section of her country was sat rificed as a battlefield for the struggle between the was as rificed as a battlefield for the struggle between the forres of evil and the forces of right. Fvery time the Germann advanced evan a foot that much more of the soil of France was invaside, Tunned despotied Every time a mine was blown every time a shell whether from German or Alled cannon, debonated that much more dainage was committed on Prench property. And bus dreds of thousands of French ritisms awer brought into direct contact and suffering with the forces of militar-sem and those of outraged ovulsation.

ism and those or outraged environments.

Besides all this, France maintained an army of 200,000 men in Salonies after having given her cooperation to the British at Gallipoli. The French navy had already effected the evacuation of the Berbian army of 120,000. effected the evacuation of the personal and without loss from Albania to Corfu where they were re without loss from The navy equipped and restored to fighting form d the transport service for troops and their supattack in Macedonia under the French General Franchet d Esperoy led by Franch and Serbian troops supported by British and Greek troops, broke in the Serbian Serbian Company of the Compan armies and caused their unconditional surrender in a tew days time

Some figures will show the military effort of France 7 700,000 men have been called to the service since 7 700,000 men have been called to the service ance August 1914 Approximately 1 400 000 have been killed and 1 000 000 are dasabled or mussing. In spite of these losses France was not exhausted for she was able to maintain an army of 113 divisions on the Western front until the last days of fighting. At the time of the angung of the armsitos, there were still close to 3,000,000 Frenchmon in the advanced sone of the French front. mobilized by France from the outbreak of the war is given as follows

gven as follows
August 18th 1914 — Officers, 92,828, soldiers, 3,780,000
February 15th 1915 — Officers 97,753, soldiers, 9,000 to February 15th 1915 — Officers, 195,814, soldiers, 5089 000
January 1st 1917 — Officers 115,004, soldiers, 5028 000 January 1st 1918 — Officers, 128,372, soldiers 5024,000 January 1st 1918, the infantry mumbered 2100 775 artiflery, 990,645, avature, 50,285 cavalry 164 422 engineering corps, 185,110
Behind the firing Inn, during the long war, factories were required to manufacture shells guiar machine guiar, and equipment and supplies of all kinds In August,

1914, France had lost first, the region of Briey, riaron secondly the coal mines and the iron works of the northern departments Out of 127 blast furnaces, said a prominent German metallurgist 'only 30 may

said a prominent German metallurgest only 80 may produce page on an a francis handcape—in spite of the lack of coal and or on France was able to manufacture every war material in October 1918, Franch plants were truring out 180 000 75 mm shells per day instead of 13,000 in August 1914 45 000 of the 155 mm shells, seed of 13,000 in August 1914 45 000 of the 155 mm shells aper day instead of 200 60 guns of all cublers were being produced per day 150 to 160 light or 'baby' tanks per month and 7000 avstation engines every 30 days. For every 100 materials which France had at the beginning of the war she had 29,000 at the termination of houtlities. For every 100 machine guns, she had 7 000 Ande from meeting her own requirements, France furmashed 1,380,000 rifles 15 000 automate rifles 10,000 machine guns and 800,000,000 rounds of rifle simmunificial to various

and 800,000,000 rounds of rifle ammunition to various Allies The American Army was equipped with French cannon until American artillery began to flow across the ocean during the closing days of the war France had to croste a heavy artillery from the 300 heavy pieces at to be a newly arthery from the oblinery propers at the beginning of the war, she built up a heavy artillery strength of 8,000 guns, while seading large numbers of heavy guns, particularly 155 mm, to Russen, Roumania and Serbia, and to the Americans in France At the close of hostlines France possessed 17,000 canons, and 8,000 trench mortars and small 37 mm cannon used by

In aviation, France has built up a vast air fleet Starting with 100 airplanes in the French army of 1914, the closing days of the war witnessed a French air force of the cloung days of the war witnessed a French ar force of 400 'machine of the latest 'type. The purmit types developed by the French, particularly the Neuport and the Spad, have been used by all the Alibed armses. Ande from meeting har own demands, France supplied armses arplance of various kinds to be Alies, modularly America. The industrial officit of the Republic could not have a matanack without a corresponding financial effort.

been sustained without a corresponding financial effort Notwithstanding the loss of the regions of the North conventuateading the loss of the regions of the North, which paid 25 per cent of the total amount of Freach taxes, the cutsean of France were in 1918 paying to the State 800 per inhabitant, or \$1,051,73,160 while they yearly paid before the way, 750,77,816. The total war seems of the control of the contro

The three war loans (1915, 1916 and 1917) resided \$5,882,955,780, and the fourth loan of November, 1918,

is still two seconds at this writing to know what it has natural. Through short term treasury bills there was obtained \$4,973,33,007. Foreign countries loased to France \$4,711,720,890-Danjand, \$1,300,390,355, and United Stelas, \$1,811,121,680. The Banks of France and Algoria advanced \$3,502,355,321. Thus there were raised, in all \$24,599,611,190 during the course of the war, which met all the expenses of France of which the total amounts to \$22,646,328,552. In that was which withdraw from the national life all the bast mas, the additivy of the women was one of the most wonderful things France has shown to the world The Franch women, prepared by the powerful feminus organizations which existed before the war, were proposed and were anxious to play their part in the struggle

The Fessoh women, prepared by the powerful feminus cognizations which existed before the war, were prepared and were anxious to play their part in the struggle For educational purposes, thousand of young women took the place of the schoolmatters or of high school professors, 18-50 women taking the place of \$50,000 mm in the subread estimativistics more than 15,000 women in the subread estimativistics more than 15,000 women in the subread estimativistic more than 15,000 women and the commenced houses, large number of women and other than 15,000 women and the women were extensively employed. In the army services and various administrative bureaus, 180,000 women took the places of major the place of major than 150,000 women took the places of major the place of major than 150,000 women took the place of the plac the places of men.

French women have been members of town councils came of them—for metance, Mme Macheres, "Mayor Some of them—for instance, Mme Machera, "Mayor of Soussons"—have struck the German with annasuement by their drumoses and audacity Others, such as the young sebold mistresses, become mayor's secretaries and ruled, to the great wonder of the failing town councils was townships with the same genus as they would their own home. The Franch Red Cross is entirely organized manufactured to the secretaries and the same than the fail of the sound of the sound that the same than to random unitions, wemen were email to the same than the same than the random thous, and the same than the random thous were emailed to the same than the same than the random thous, and the same than the random thous, we were the same than the same than the random than the same than the random than the same than the random than the same 
Thanks to the efforts of the recrease in and the Assistant for Ammunitions, women were email the war industries. To protect them and the Assentant for Ammunicous, wouldn't were employed in all the war industries. To protect them against all risks, to secure them good wages and good health, a Committee of the Work of Women was created whose efforts have brought in the war industries more than 500,000 women

For every two women working before the war there were in January, 1918, 781 in iron works 148 in chemical works, 630 in the transportation business, 161 in woodworks, 430 in the transportation business, 101 in wow-working industries, 111 in the leather industry, 104 in rubber, paper and pastoboard factories, and 102 in various other trades. Altogether in agriculture various ad-ministration bureaus, war industries and so on, more and only wormed were engaged in war work. Thuirs than 1,500 000 women were engaged in war work. Theirs has been a great contribution indeed toward Allied

And it must be borne in mind, when thinking of these And to must be borses in mind, when thinking of these figures, that France is not as big as the United States Great Britain, Austrias or Cermany in point of population the population before the war was between 39 and 40 millions, exclusive of her colonies. But the Republic west to war heart and soul. She put the very best she possessed into the great cause, regardless of cost

And with the victory won. France is ready to resume her proper piace among the leading nations of the world, with full assurance of a durable peace

### Landing the Airplane on a Roof

To be really practical in everyday life, the airplane must be capable of landing on housetops in crowded metropolitan districts where there is no land available for a flying field. Otherwise it would profit an acrial commuter but little to make a flight of say 25 to 30 miles every day from his home in the country to his

only to have to land at a flying field somewhere outside the city and then have to travel a half hour or more to reach has office

It has remained for Jules Vedrines, the famous French airman, to demon-strate that even the ent-day sirplane can land on a roof if properly handled On January 19th On January 19th last, Vedrines set out from the avia-tion field at lasy les tion field at key lot Moulineaux, not-withstanding a thick fog, and flow toward Paris He flow rather low over the builtwards in

alightly damaged

The roof on which Vedrines landed is 52 feet wide and 75 feet long The machine employed was a Caudron

Caudron after alighting on the roof of a Paris department store

tractor biplane, equipped with a rotary engine. Its Its span

Vedrines won a prize of 25 000 france (\$5 000) for eing the first airman to land upon the roof of a house during a flight

### The Sighting Problems of the Aviator

ONF of the greatest difficulties experienced by serial fighters when machine guns on airplanes came into general use was to bit the inrict aimed at I his may seem to the uninitiated like a bold statement of poor marksmanship but in reality it is not. As a matter of fact to bring down an enemy machine without specially designed sights is nothing more nor less than pure, lulterated luck

I or instance, imagine two machines passing each other tor instance, imagine two machines passing each other along parallel lines 100 yards apart cach traveling 100 miles per hour You are (quippid with a machine gun fring 700 shots a minute-11 each second-the bullet traveling at the rate of 4 960 feet per second If you cook a dead aim at the eneury machine your first bullet would miss its mark by 18 fect and the second bullet, coming ft of a second behind the first one, would miss its mark by 45 feet

To offset this, and to make arrial fighting more of a science, ring sights were divised. These sights con-sist of two rings, a small one representing the bull s eye and a larger one encuring it representing the line of flight of the bullet If aim > taken when the enemy

machine is crossing the outer circle (the hostik aircraft boing 100 yards distant and traveling at the rate of 100 miles per hour) the builet would reach it as it enters the smaller ring constituting a direct hit

But this only compensates for the speed of the enemy machine You still have to make allowance for the speed of your own machine. This is done by means of the Norman Compensating Foreight a head sight fitted to a swivel with a wind-vane swinging in one side which raises and lowers the head and revolves on its axis

according to the pressure of the wind in the slip-stream.

The most wonderful of all sights however is the Aldis Optical Sight used for stationary guns who firing through the blades of the propellic. This sight was in vented by the two Aldis Brothers manufactures of lenses who under subsidies from the British Covern mont have brought the making of light grad kness to a higher point than the German's finest workmanship

The Aldis sight is virtually a telescope which neither magnifies nor diminishes and which, unlike an ordinary telescope can be used with the eye se eral inches from the end of the tube

When looking through this tube at a distant object the effect is exactly as though one wer looking through a napkin ring—the object appears the same whether it is seen through the tube of outside it—but, apparently suspended in the air is a ring sight. The peculiarity is suspended in the air is a ring sight. The peculiarity is that the ring is seen with its center on the spot at which the tube is pointing no matter where the eye is placed If the eye is moved sideways the ring ppears to move with it through the telescope so bet the direction in which the tube points is always toward the center of the ring

The tube when fixed rigidly to a gun thus constitutes Incutbe when fixed rigidly to a you thus constitutes a sight which offers prictially no ob ruction to the view, and which shows instantly the spot at which the gun is pointing without the necessity of along the eye on a front and back spht. The affect produced on the pilot of seeing an enony machine flying into this ring suspended in mid-art is quite starting. One advantage of this spht is that it can be used with

both eyes open. One eye sets the object and the circle through the tube the other eye sees the object threet. The effect, after a little practice is that the object is seen as clearly as though there were no sight at all

The tube is about three feet long and about three inches in diameter, and contains five specially constructed and arranged lenses

One fact about aerial fighting however which has never been ment oned is that after the first sight liss been obtained, the pilot never uses his sight at all. He watches the bullets—littrally! That is, he watches the tracer ammunition. One in every three shots is a tracer a bullet which trails a little path of smoke, and it is much more interesting to watch the tracers than it is to keep the eyo on the sights. Most plotts would like, to use all tracers if they could for they kill as readily as the regular bullets. But unfortunately, tracer am-munition is dirty and will soon choke the hore of the As it is a great many pilots load their magazines and belts with every other one a tracer though it is strictly against the rules. The temptation though is too great to be resisted

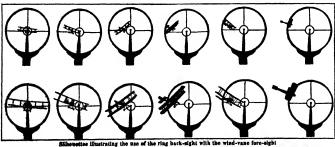

The tracer is made the same as the ordinary bullet except that in the end is a small quantity of magnesium which ignites. It is not quite accurate as it is lighter and drops a little in its flight, but it serves its purpose wonderfully

There is a fortune waiting for the man who can devise a tracer that will not foul the bore and which will

accordingly permit the aviator or in deed any machine gunner operating at short range to em ploy it exclusively

### British National Restaurants

N a statement given out to the press recently, Mr Spencer, director of national kitchene and restaurants of the Ministry of Food in Great Britain, said that the new National Restaurant is now making a profit of \$500 a week In view of its success additional restaurants are being set up in London and in

r is set for the estimated speed of the adversary while the latter automatically compensates for the speed of the plane on merchied. The tipper vow of allocustics is for a range of 200 yards the lower row shows the same objects at 100 yards

### Some Non-Poisonous Gases and Their Uses

It seems to be the way of the world that the little sheep of the family shall increase the most publicity and this applies to mid risk as much as to propt. It amy court the way tage in use prepared to this use presentioning gases as used in worlder every if he does no being in the circum met 1 v. be lad who wish if the exclusive might be in public to all your extraordinates and to be a superior of the land of the latter who will be the middle of the latter who will be formed to the latter w

### Quelling Mobs with 'Tear" Gas

As has beer sard previously one and possibly two of the war divel pred gues discrete to be kept as offensive weapons of the liw while substances which product dense volumes of harmless smoke have no doubt come to stay. They are altogether too useful as a reas for operations in the field to be discarded and form an ex-eclient method of defense. The gases to which reference gases Highly efficient gases of each sort which refer field harmful effects are now available for use against mob will be more effective than any other puthod for breaking them up and giving the antividuals something to divert their attention. They will reach where water so often used cannot penetrate and the effect is for a longer time It will be recalled that in the Philippine campaign the Americans were required to fight the fanatical Moro who wilcomed death and conducted a difficult kind of warfare. There was an instance so we have been informed where the warriers used as a shield their women and possibly children and occupied a position such that our troops must kill or be killed gave rise to considerable criticism of our troops and it seems probable that a few gas shells would have made the story quite different. Continual successing and the eyes blinded with harmless tears for a few hours ought to give any fanalu a change and direct his few thoughts into

### T N T from Illuminating Gas

Illuminating gas has been able to play a war part-because of the oil used to earbrive water gas in order to increase its candle power. In many states the heating value or B 1 U (British Ihrmal Units) of the gas is the standard, saves the graviest volume of the gas is the standard, saves the graviest volume of the gas is buried for laciting purposes or in maintic buriers where the temperature of the maintic and not the candle-power of the gas of terraines the illumination. Investigation showed that some 2 per read of the oil added could be received, as colonel which as the starting pount for T. In a serial out that some 2 per read of the oil added could be strong to the starting pount for T. In a serial out that precious hydrocarbon. A number of the strong bard was the strong pount of the T. In the strong the strong was the strong was the strong was the strong was the strong which partly telind per trolcum trackes counter current to the gas subscribing the hydrocarbons formed by the cracking of the petrolcum. Distillation under correct conditions separate out toloud, beared and inspital the oil may be returned to the towers the beared and inspital the oil may be returned to the towers the beared and inspital the oil may be returned to the towers the beared and the end of the strong of the petrolcum of the two treatment purposes.

### Methods of Producing Hydrogen

Balloons played their in pretrait part over there' and a balloon is used so without gas. Not in gos must be beyond that an other and so that the pretrait part of the pretrait part of the gas lived for colors and the another and still be prefeated for colors and the another and still be prefeated for colors and was been the balloon gos and yet it is very highly manimable and even explosive when must with the right proportion of air. The companitive case with which it may be dear and the still be sufficient to the prefeated of the prefeated for the prefeated of t

spong, aron at a temperature of 900° to 1 000° ( where upon the ron takes up the oxygen present to form aron oxide leaving hydrogen of reasonable purity. Taken from van Nostrand s Chemical Annual

The critical temperature is the temperature below which
gas can be condensed to a fiquid and above which it undergoe

compression without liquefaction in the thought to make a compression without liquefaction in the critical temperature. In just count, to condense the gas to a liquid. When the temperature is lower than the critical temperature less pressure than that indicated will cause this gas to liquid.

action of a rid on metal such as suffairs and on iron, aine or magnesium has been used, but thus is no longer am ployed because of the mountain of raw material needed a small airship of 500,000 cubic feet especify requiring the reaction of about 60 tons of acid with 36 tons of iron to fill it with hydrogen. The latest dimplied is of nearly 5,000 000 cubic feet bengal designed? More recently cleertorlytic hydrogen has couns into prominence especially for the air of possee. A weak acid or alkali solution is authoritied to the suffair of the such acid of the suffair of the

### Cracking Natural Gas to Produce Hydrogen

A novel source of hydrogen is natural gas wholn may be craviced to produce the hydrogen from the methans present if a checker-work of brick is heated hot enough by burning gas and first the sum may be defined in the best as a hydroduc. The gas after may be compressed in the unant manner. When may be compressed in the unant manner. When the same had a six a laking petroleum may be cracked with the same results by spraying the raw material into a property beat of chamber. The temperature of operation has a direct effect on the yield and purity of the gas.

Hydrogen is sometimes produced from water gas by the fliguration of the cabon monoxide. By using this earben monoxide for fuel, enough power is produced to operate the plant the labor charge is relatively small, and at Ferrari, Italy, where the Linde-Frank-Catro process: a operated, hydrogen of 97 per cent to 98 per cent jurity is made at a cost of about 25 times the cost of water gas are required to give one of hydrogen and any earbon duxide is removed by exclubing with water under pressure. As an added precaution a solution of sodium hydroxide may be used to take out the last of the catron disords may be used to take out the last of the catron disords.

### Cutting Metals with the Oxy-Hydrogen Torch

The important uses of hydrogen besides acconsisting are in combustion such as the cxyl-hydrogen flame and the lime light, in synthetic ammonia, as an inert alugabler and in oil hydrogenation. That used in acconsisting the might form compounds determinated to the ballion labric while each 1,000 cubic feet should lift a minimum of 68.5 pounds. A practical billionist will judge the ballionist will judge the

Neithetic ammonia will be discussed another time hydrogenation is one of the bissings which one proferrais writer claimed for the military party, helding that without cheap hydrogen required for Expedition or progress could have been made in changing dete said citility, on the steerle cast, (rilled, by the add to no of hydrogen, II, in the presence of a catalyst. The hattory of hydrogenation hardly switness the argument. The process has become one of much economic importance and is just starting.

### Habum from Natural Cas

More recently it has been found that some natural gas contains a rar gas, heltium in much larger percentagina does are or any other source and this gas possesses the distinct advantage for balloons, of being non-inflammable. The various properties have been known for some time, but the large amounts of air which had for some time, but the large amounts of air which had contained the large and the large an

whether it would have been so thoroughly tested but for the impectue of the war and indeed the quelkening of many lines of industry, the proving of ideas, the deniration of men winestimas shead of their normal turn contration of new inventions shead of their normal turn. Thus far the 80 02 has not been realized, but about 50 08 has, and when the armsittee was signed some 150,000 cubic feet were ready for shipment. Imagine the sensations of a man used to working with helium at 32,400 a cubic foot upon seeing cylindees holding 150,000 cubic feet. The natural gas relieved of the shium was allowed to evaporate into the mains and was none the allowed to evaporate into the mains and was none the feet of the ship of the shi

### British Ideals of Reconstruction

"Rebuilding the National Life on a Better and More Enduring Foundation"

By C. H. Claudy, Special Foreign Correspondent of the SCIENTIFIC AMERICAN

WITH a reconstruction problem of infinitely greater magnitude than that which confronts the United States, it was only to be expected that Great Britain would be devoting much serious thought and attention to it, long before we of America did more than recognize that we might come face to face with such a problem of our own, after the war. There is nothing surprising in England a Ministry of Reconstruction, in her careful plane, in her able working out of a general scheme and the painstaking attention which has been bestowed upon plans, in ner anie worning out or a general solution and the painstaking attention which has been bestowed upon its details. But to find not only an accurate scientific, exact grasp of the problem in its practical aspects, but ideal of reconstruction may be as surprising to

and an according reconstruction may be as surprising to those who read this as it was to him who writes it. If the average American business man were asked to sum up in a few words his conception of the national characteristics of the average Britisher, leaving out all characteristics or the average intrinsier, leaving out all considerations of national pride, he would in all probability give equal weight to buil-dog courage high tenseity of purpose, infeatibility of will, and a conservation of viewpoint largely influenced by ancient tradition in deed, more British people will admit the latter than boast of the former. When therefore one finds the people of this nation widely wideawake to the fact that the war has presented them with their most tremendous opportunity for a real reconstruction of those features of industrial and national life which have been, at from the American standpoint most restrictive of her trade and industrial expansion, one is brought very sharply to the realisation that the effect of the war is by no means confined to material but spreads to mental and political life

Were this new spirit sporadic and not general it would

deserve in the wapper approach and not get deserve in the attention But it is national, and it is governmental For instance from government publications the following excerpts are taken as beautiful in cone ption as they are practical in application

The idea of Reconstruction of a supple return to pre-war conditions has gradu-ally been supplanted by the larger and worthier idea of a better world after war The experience through which the country has passed has enlarged its sense of what is possible, and at the same time quickened its sense of what is fair and right

Even more illuminating is this (and it ems but fair here to beg the pate seems but fair here to beg the patience of one s readers lest they think this story is visionary and impractical, to say that without this preamble the real vision of what the British themselves think of their own reconstruction problem could hardly be here presented even in skeleton form,

in a scant page of matter) Reconstruction is concerned both with questions which will arise in the natural course in this and every other country, when the nation is switched back into the activities of peace-time and it has to give shape and satisfaction to the strong feeling which has arisen in all sections of the community, among men and women of the most widely differing opinions and out-look, that there is very much to be sahamed of when we look back to the conditions of July 1914, and that out of justice to the living and out of reverence to the dead we are called to rebuild the national life on a better and

more enduring foundation in the bar a vector and more enduring foundation.

These words express better than any of mine, the underlying ideal of reconstruction here in highest it must not be a mere readjustment, or even a restab-It must not be a mere readjustment, or even a reestab-shment of pre-war conditions its most important phase, in every one s mind, is the creation of anew system, a new ideal, a new plan for industry, fer labor and in some lines at least, for government

### ation of Mon in Indi

Practically, the two greatest tasks in any getting of a war-pursuing nation back upon a peace footing are demobilisation and relocation of men in industry. It is such a problem which confronts the United States is such a problem which controuts the Universities of Already our industries are saying to our government, "Just let us alone and we will reconstruct ourselves." Our national idea seems to be to get back to what we were, then to burry up and make up for lost time, but, except in a few scattered instances, rarely is it to remake either an andustrial or a labor pointy The United States Government has no Department of Reconstruction, and as one government official engaged in an attempt to do some constructive work along these lines said to the writer just before he sailed If we lo got a reconstruction policy and start it working it will probably begin to function just after our resignation; that completed staclf1

But Great Britain feels that she faces a much larger problem than is contained in the more demobilization of the armed forces the getting learn a back at paying jobs, the resettlement of civil was workers the releasing her industries from the many g vernm ntal r strictions under which they have had to operate for four long years She feels that there are conditions everywhere which should be changed, must 1 changed. Old ideas must should be changed, must fining a fining a give way. The dation must grip by the board Because it was always so us no long a reseon for its item, as now. And because this clining is no strong every where just as the feeling was so string everywhere the state of the strong everywhere the strong everywhere in the darkest days that Ingland must me so does it seem as if from these three strikes it as the natureton which more than a relocation the distribution of the second control of is more than a relocation readjustment and resultle ment but which is nevertheless tol kept up in a severely practical basis must come a n i h more prespensis much more alive and much n re offi sent industrial mechanism and very laig ly a better social and

### Importing and Distributing Raw Material

The problem in England begins with shipping What ships how many ships for lunging men hone for bringing in food, for importing rew materials for ex porting finished products Next raw materials Leather and cotton wool and metals must be secure I shapped and divided among manufacturers There is to be an

WE wish to direct careful attention to the series of articles from our special correspondent in Europe, Mr C H Claudy which will continue to appear for several months in this journal Mr Claudy has completed his work in England and is now in France The article on the British Navy (Feb 1st) and the present article British Ideals of Reconstruction will be followed by others on British Plans for Reconstruction English Railway Reconstruction From Fighting Line to Factory England's Scheme of Demobilization England's Aircraft Industry, British Munitions Future of British Fluing etc. As our correspondent is following the same general line of investigation in France it will be realized that the whole series of articles will form a valuable compendium of information which will be of the highest assistance in the working out of the same industrial and social problems in the United States - EDITOR

> international acramble for what raw material is available international acramble for what raw material is available or can be quickly produced for the world is short of primary material of all kinds due to the taking of men from production to war lack of fertilizer discouragement due to difficulties of merchandizing during the war etc Industries must be graded according to national importance no less in the raw material short days of reconstruction than during the war the unessential industry must give way to the essential a thing in it self revolutionary in Great Britain in times of peace

> Raw material secured, who shill say in whom it shall go? Government? It might work well in the United States for the United States has only the tradition o democracy behind it. But England is feudal in its generation, and class pride and prejudice are as strong among some as patriotism. If Government interferes among some as patriotism If Government interfere too much in times of peace Government may be over thrown Now, mark the wisdom here shown government has decided not to ration law materials government has decided not to ration law materials ; individual industries, but to industries in a grou Representative Councils made up from both Finployers and Trade Unionists will be citated within the principal industries, and these will decide when rationing is necessary, as between manufacturer and manufacture

> sary, as between manufacturer and manufacturer With shipping, raw material and distribution of raw material out of the way comes the transportation probem, the remaining of neglected roads the future of a rundown railway system already resized to be archaic in many respects if spieadd in others the expansion of the canal system, the development of scral transport and here, too comes in the matter of the dumping of army stores upon the nation and the way for instance in which thousands of motor trucks miles of wire, tons of manufactured articles bought for the army are to be

delivered back to civil life without dislocating the indus-tries and impoverishing the labor which produces such

Next comes the recatablishment of the labor force the transforming of an army of solds results an army of workers. The demobilization scheme has already been taken up by the present writer as handled both at home and here civil war workers reestablishment is a story in itself co peration between employer

But after the labor the material the factory and the transportation are all brought together comes one of the ideals of reconstruction in what spirit is the work to be done? Increase the national output is sing gested by many as the chief ideal of the new order with the idea that debts cannot be paid nor the condition of workers improved nor the cost of living reduced unless the new efficiency of production is held as the first conscieration. But here comes the returning soldier who has sacrificed time sometimes health and always his prolucing force to say that the low paid conditions of an earlier era are gone for good, and that the pre war condition of a continual state of armed neutrality between employer and employed must be altered. And so the British laborer and the British employer are both brought to understand that mereased output and improved laboring conditions must go hand in hand world be youd the sis can here show the way True we have yet to teach it in its entiroty to ourselves, but we have a thousand milustries now where Britain had one before the war where the most ideal of working conditions and the highest of wages have gone hand in hand with vastly increased output and high profits to the

business It took American standardisation and efficiency to manufacture cheap automobiles typewriters harvesting machinery and super-accurate watches at an ab-aurdly low price while keeping working conditions and wages on the highest plane With Great Britain this is no longer a

dream she is putting it into effect Whit is known as the Whitly Committee on Industrial Reconstruction has done a noble piece of work which is even now bearing fruit Broadly it consists in the establishment in the highly-organized and istrice of joint councils of employers and trade unimists They are both national and local to individual industries and in addition they are according to a pronouncement of the Ministry of Labor, "the normal channel through which the Government will seek the experience and advice of industries It is generally held that the establishment of such councils is

the most promising development of the new ideals of re-construction which have come to be as a result of the war, and that there are fou factors which will more happily aid in the solution of the greatest of all problems of the day the labor problem

Amelioration of working conditions has been former a by-word for years Figland s idea now is not amelioration by small changes but a sweeping deal by which the laborer will get what he should have to produce his lost with the greatest hall iness to himself as well as the greatest profit to his enilloyer The whole industrial fabric is being closely investigate and hours of labor wages regulation of earnings health sanitation safety accidents insurance nightwork over-time holidays continuous hours meal times and hours dangerous trades industrial control and child labor are all under the microscope of the Government as well as the scrutiny of those who favor the old system and those who clamor for the new

### A New Rural Life

In the ideals of reconstruction comes a new rural life, better land laws, the use of land for public rather than private interests (a story to be told at greater length later) the reclamation of waste land the parceling of it to soldiers and sailors the increase of agriculture and the diffusion of a new school of thought in old agricultural circles Health, housing and sanitation are receiving attention as never before, and adult education that the nation need not wait on the younger generation for a speedy acceptance of the new ideals of national life has a prominent place in the plans of those to whom British Reconstruction is a gospel of regeneration not a more readjustment of a dislocated empire to its pre-war days

The primitive tanks, holding ten sarks of seed each, used in the early stages

The experimental apparatus used for demonstrating the electrification of seeds

### The Electrification of Seeds

### A Revolution in Agriculture

By Charles A. Mercser, M.D. F.R.C.P., F.R.C.S

FROM time to time arts have been revolutionised I by the ifforts of individual men often men not brought up to the art but practicing in a very different brought up to the art but practioning in a very different coctupation. Arkwight a barber revolutionized the art of spinning. Cartwright i delegionan revolutionized the art of weating. Watt a maker of mathematical instruments. Evolutionized every heavy industri-Rowland. Hill a schoolimater revolutionized our communications by deviung the penny post and Mr. Try an electrical is revolutionizing the art of agricul

For to produce a large increase in the yield of corn and other crops and at the same time a material improve ment in quality and to do this without any increase in the farmer s expense without requiring any additional implement on the farm or any new acquirement of skill or any ad him all expenditure of time on the part of the farmer -this is nothing short of a revolution in

agriculture and this is what Mr. Fry has done
Flectri its has long been applied to growing crops
and has had a decided effect upon them in producing more rapid and more luxuriant growth but to subject a plant to electristy eith r continuously or at intervals during the whole period of its growth requires a con-

siderable supply of electricity and more or less continuous and in it or less continuous attention to apply it over large areas of many neres must necessarily be rostly, and to apply it over hun-dreds and thousands of acres dreds an I thousands of acres is scarcely practicable especially as the installation of wires it to must neces sarily interfer with the operations of agui ulture For horiculture it is no doubt practicable and may be found useful and even profitable but the difficulty of applying it on a large scale to agriculture is evidently considerable and Mr Fry turnel his attention to the ch trancation of seeds which is op it to none of these drawbacks

The process is novel. There was no previous experience whatever to go upon and the inventor had to feel his way gradually to success by the tedrous process of trial and error making many mistakes on the way suffering many disappointments, checked in every direction but the right one and learning from every failure the way to success Beginning hat in a few pots the experiments were soon extended to a patch of garden ground then a neighboring farmaniager was persuaded to so very reluctantly and sorily against the grain, a few plots of agricultural land beeing the results he was less reluctant the next season and as year by year his crops from electrified seed continued to contact favorably with those from untreated need he sowed a larger acreage with the former, until in tach field for comparison and from being an utiler sceptar, h. is become an inthinsiastic advocate of the process

Farmers meet at market and talk about the weather and their crops and thus nows of the process spread in the neighborhood and one farmer after another adopted it first only as a trai, and on a few acres of ground, but when they had had experience of it upon larger and larger acreages until at the present harvest 180 farmers have respect grain growing from electrified seed. I armers are a cautious and conservative race not eager to adopt new in thods until these have been well tried at other people s risk, and have had their value proved beyond question and those who tried the electrified seed for the first time tried it upon a few acres only, so that the total

acreage thus sown last season was not much more than 2,000, but 2,000 acrees is quite enough ground to yield a thorough and satisfactory test, especially when the trails are scattered over many different oparts of the country, on many different soils, from the infertile sands and newly plowed heaths of Dorset to the chalk afound Salubury Plann and the stiff olays of Chashier No doubt much larger acreage would have been newn with electrified seed if efforts had been made to spread a knowledge of its advantages, if the inventor had not waited with the intention of perfecting his process and discovering all its possubilities before taking any steps to make it knowledge. to make it known

But it seems that the possibilities are almost unlimited suit t seems that the possibilities are almost unimited. The more is investigates it, and the wider the scope of his experiments, the greater are the advantages they reveal. As it is quite enough is known, first to prove that the process is one of very great value if properly conducted, and second to enable it to be conducted to conducted, and second to enable at to be conducted to the best advantage, eliminating with certainty all the errors that vitiated the results in some of the early sep-perments and ensuring without fail a substantial is-crease in the crop. This is enough to justify, and indeed to demand, the use of the process. It would be us-justifiable to withhold the process of the pro-cess of the process of the process of the pro-cess of the process of the process of the pro-cess of the process of the process of the pro-cess of the process of the process of the pro-cess of the process of the process of the pro-cess of the process of the process of the pro-cess of the process of the pro-cess of the process of the process of the pro-ses of the process of the process of the pro-ses of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the pro-cess of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of the process of the pro-tes of the process of the process of th

contains are not yet become available is practice, and the invantor has at length been prevailed upon to piles it on the market as it is. In the first place, there is a notable ingrease in the yield of grain from the slectrified seed. An average crop of wheat is Graet British is about 30 bushble per arm, if pairs 4th to the present of the present Britain is about av pusses per acre, of oats 46 to 80, of barley 32 to 40 bushels. If electrafied and unele are sown separately in same field on the same and treated in every rea unelectrified by fre

and 30 per cent of ing The quality of the

Oats, cabbage and kale grown from treated (left, in co ch case) and untreated (right) seed, under identical conditions

the traverse in weight has ranged reason to the same of the process of the properties of the weight of an average contact which is should 55 pounds, but the portion varietions from this average when the process of the process of the probeamen, seems as soort do potental, but the symmetry variations from this average weight see not wide A poor sample of wheat weight see not wide A poor sample of the bushels as not grant of the bushels as not exceptionally fine ample. It is evident that a gain of from one to four posseds to the bushel may make all the diffusions between poor and good, four poisseds to this bushel may make all the difference between poor and good, bestressing good and excellent but means bester spilling quality, less offial, and more flour per bushel. It may mean all the difference between grain that can be used only for milling and grain that can be used for media.

for need.

Even this is not all the advantage to be gaised by using electrified seed. Besides the investee in the bulk of the yield and the increase in the bulk of the yield and the increase in the weight per bushel, there is an increase in the singlet per pushed, there is an increase in the singlet per pushed. In the first place, the discrimind seed thrown up more straws from each seed than the uncelestrified. In non field of oats the In the first increase was characterised by a previously sceptica expert as "asteunding," for whereas the bulk of the unexpert as "asteumeng." for whereas the buts of the un-electrified seed had thrown up only two straws per seed, the electrified seed thrown up five. In the second place, the straw growing from the electrified seed is longer than that which grows from the unelectrified. The straw that which grows from the unelectrified. The straw is in some cases only one or two inches in other cases as much as eight inches, longer, but in every case the length is increased. In the third place, and this is the most important, the stoutness and the strength of the straw are increased. From this it results that the crop is less hable to be laid by storms of wind and rain hable to be laid by storms of wind and rain In one case the wistions to a farm, who had gone for the purpose of snapestung the electrified and unelectrified crops growing side by side, asked the farmer to show them the dividing line between the two Go and look for yourselves said he "No one but be lind man could full to see the difference And truly; it was O. On half truly is were S. On half truly is two as On half the truly the second to the second to the second the second the second to the second the the ground, laid by the recent thunderstorms. On the other half not a straw was laid the whole crop was standing upright waiting for the reaper

e that have been mentioned are not all the Even those that have been mentioned are not all the advantages that may be gained from electrilying seed corn. It seems that corn growing from see of thus treated is less esseepible to the attacks of fungue sleeness and wireworm than that growing from seed that has not been treated Lattle can be said at present on this score, for the observations are as yet incomplete and experiments are in progress that will test the matter up to the fift. All that can be said at present is that there seems to be a great likelihood that the process is protective against smut, bunt, rust, and other fungus diseases.

So much for the advantages of the process now what of its disadvantages? These are few and can scarcely be considered serious first is that if the process is not properly carried out, the result will be disappointing. This can scarcely be considered a drawback to the process teelf It is a simple process easily per occupying only a few hours, and no more difficult occupying only a lew hours, and no more dimenti-than the process of dysting a parcel of yarn or sterilizing a surgical dressing, but his these operations, it requires the use of a certain tech-nique, and cannot asfely be entrusted to in-experienced bands. Properly performed, it can neither damage the seed nor fall to enhance its

Secondly, the effect produced upon the seed is

Secondly, the effect produced upon the seed is not permanent, it will retain its enhanced efficacy only for about a month after electrification, only for about a month after electrification, that the seed he sown promptly after it has been that the seed he sown promptly after it has been that it not known and ellowed fee, it may lead to datapoint the seed and the seed of the

Seed being dried in a kiln after electrification

stood, but at present we cannot say beforehand whether the crop will be greatly benefitted or only moderately benefitted

The process is very simple in principle though it requires a good deal of care and of equire ince in carrying it out. A current of sleatiesty cann it be passed through a heap of dry seed, the grain must lesteeped in water that contains in solution some sait that will act as a conductor Such a solution is placed in a tank the seed is steeped in it and a weak current f cleatricity is passed by means of electrodes of larg surface attached to two opposite end walls of the tank. The seed is then taken out and dried

out and dried. This is the outline of the process but the outline needs a good deal of filling in the kind of salt employed to enable the water to crident the decrease, it is not without important. Sed that is to so sown on one kind of all will visib better regular with a calcium salt and sed I that is the sawn on another kind of soul will visib letter results with a sodium or some other milt. One kind of seed will need texture the soul many the solid many than another will need texture the few many him. with a social or some oracle sait the kind of seed will need treatment for so many hers and another kind for many more or fewer black for makin meeds twice as long treatment as wheter each the atrength of the solution and the sit night of the current atrength of the solution and the stringth of the current must be appropriate and are not no essent) the same in each case. The drying is very important. The seed must be dried at the right tenj reture nother too rapidly not on slowly—and it must be dried to the right degree mather too much nor ter little.

All these matters are important and it is possible that variations in them are resp nell for the variety in the results that are obtained | 11 | r | r (restment bas is experiments with e ascertained by long and each kind of seed and it is only by legrees that the which have now been in progress fresh or seven years

The Fourth Street Bridge, San Francisco, raised to its full limit

It will take many years before all the ben-efit that can be obtained from the process is finally arrived at At present, it has been worked out only for wheat, oats and barley but experiments have shown that its advantages extend to many other kinds of seeds. Turnips and other roots, muze rice cabbage and many other plants grown from seed are known to benefit but for these the process is not yet recommended because the exact conditions have not been thoroughly ascertained results have been obtained from electrifying seed potators but the results are not vet sufficiently uniform to justify its

application on a large scale to potatoes
Electrin ation of seeds will be adopted
on a very large scale in I agland for next
years harvest Every farmer who has tried it once upon a small acreage will use it freely and though it has scarcely been

farmers talk to one another they advertised at all saverined at an narmers tast to one another they see the articles written by experts who have inspected the crops and the amount of seed that will be feet trified for next years harvest will be practically limited only by the pacity of the plant laid down for the purpose In Great Britain the proce cstablished

So emphatically true is this that Dr Wray the United States Inspector in Charge in Creat Britain, after an extended tour of inspection of farms has advised his Covernment to have immediate trials made in every State of the I nion. To my mind the time for trials is past. Further trials are but waste of valuable time. We must face the fact that there is a shortage of food. all over the world and that this shortage will be most acutely felt next year. It is next year that the increased production will be required, and further trials which could till us no more than we know already would only postpone the adoption of the process for another year It is wanted now, and badly wanted

### A Well-Equipped Lift Bridge

NUMPROUS and novel safety precautions are taken in the operation of the Fourth Street Bridge in San Francisco by interlocking the motor brakes and end lock gates in such a manner that it is impossible for the operator to start the motion of the bridge until the end and safety gates at each end have been lowered Until all four and gates are entirely down it is impossible to make the electrical connection with the motors that

to make the electrical connection with the motors that raise the bridge.

After the bridge starts to rise it is impossible for either of the four gates it is le raised until the bridge is again I wred and locked. While the bridge is up it is impossible to make electrical connection with the motors that raise the gates
One of the most novel features of this bridge is the

operation of the semaphores placed at both sides of the bridge to warn navigation officers of the of the bridge to warn navigation officers of the position of the bridge at night. The semaphore consists of a semicircle lens out half of which is red and the other half white. An electric lantern is proved so that when the bridge is down it shines through the red section of the lens which is the danger sign notifying navigation that the way is not clear. When the bridge is raised the simaphor will take such a position that the lantern will shim through the white ction of the lens informing navigation that the way is clear

The locking device can be seen in the photograph A motor operation a shaft that extends across the end of the bridge and by means of eccentric connections it can be looked or unlocked by operating a switch in the bridge operating. ators room It is impossible to unlock bridge until all four safety gites are down It is also impossible to operate the motors that raise the bridge until the tridge is unlocked. When the bridge is unlocked connection can be made with the bridge raising motors

An automatic cut off or short-circuiting device is provided to set the brakes when the bridge in oning, reaches a nearly vertical position and in closing, a nearly horizontal position

A series of electric light indicators tell the

contion to the operator of the bridge at various stages as follows locked unlocked bridge fully closed, bridge nearly closed bridge nearly open bridge free and also when raised to the proper position to permit boats to pass

An unusual feature is a life saving apparatus maintained at this bridge, to save people who may jump or fall into the river at this point

Cable Mountain, Zion Canyon

A vista through the trees of Angel's Landing

### Zion Canyon and the Colob Plateau

A Little Known Region of Southern Utah Destined to Become World-Famous By LeRoy Jeffers, FR GS, Secretary Bureau of Associated Mountaineering Clubs of North America, etc.

A I THOUGH a hundred miles distinct from the nearest railway the Zion National Monument in southern Utah is destined to be visited by an increasingly large number of travellers. I eaving the lost angeles and Salt Lake Railway at 1 and one may trivel by auto across the desert to Zion Canvon by way of Cedar City On the deer(1) Zion Canvon by way of Cedar vity. On overwhan it is saye brinsh greamwool rabibly brash and shad sasle while the prickly | car licens the landwape, with it bright imagenta flowers. lack rabiblis and prairie dogs run to cover as we pass and with the increasing has the air gathers whits of that that rice no columns for two or as hundred fixed in you the floor of the desert and travel randly along for a mile or tvo mountain ranges purile in the distance or louin with deceiving reality in mirage. If one is fortunate he may see a phantom city with its buildings and steeples seeming to b but twenty miles a ross the desert sands cross a ri ig of alm set ; ure iron that is dotte i with cedars white another is com used of likek contacted volcame rock. In the foot bills are great flocks of dirty brown sheep whi h give I und importance as a shipping point

Near (edst (its there are glimpses of red and yellow walls while beyon I we follow for miles beneath the yellow gray and slate-colored chifs of the Hurri canc failt the great st of all known failts in the wild. Or the right are the little known line Valley mount uns while beyon! on the road to St. C. rg. is a brilliant pat h of therry relisand an unmetakable landmark who h an uninerazioni indulura with in secu from the lar listant height of the Colib Platea Ner Foquer ille is a clust r f blaci volcana cones while aby the village lines of varietiere 11 ittes rise one upon another in im sug

After a very steep as out ther opens before us a glorio is vi s temples and butter aglew with marvelous coloring in the a time marveous cooring in the 4 ting sun Towering above is the Great Temple of the Virgin locally known as Steambout Mountain 7,650 feet the highest in the region From the banks of the winding, treacherous Rio Virgin slopes of green lead to a desolate desert region extending to the base of the red cliffs which are dotted here and there with pine and cedar. Then follow vertical walls of gray and white streaked with color from a vermilion butte which crowns the mountain like the upper deck of a steamboat Its brilliant walls are top od by a rich green forest of pines the whole making an unforgetable combination of form and color Iooking upward toward the Colob Plateau we see the most curious red and white domes,

riacian we see the most currous red and white consess, while across the river that enny less of Smithsonian Butte are painted with self-reds and browns. We pass (ration, Rockwille and 'q-ingdale currous old Mormon rettlements of stons and adobe on the banks of the Virgin and of the North I ork near its cultrance to Zion (anyon Tall 1 pollars line the streets through which there flow streams diverted from the river life-giving and purifying alike for man and beast. A new era dawned for the valley with the summer of 1917 when it was first opened to automotiles and fruit and produce were in increasing demand. So important are the scenic wonders of this little known region that in the spring of 1918 the President increased the size of the Monument reservation from 15 840 to 76 800 acres

Near Springdale we have an unequalled view of the Great Temple with its sublime procipies of 2 900 feet

Beyond a canyon on the right is spanned by a natural bridge in process of formation while, on the opposite aide the fantastic Towers of the Virgin astoniah us with sure the innitiative lowers of the virgin astonian us with their unusual architecture and their wind huse of red, of orange and of white. I rom a climber a roint of view, few of the sandstone walls of the valley are attractive during the heat of summer. Circutous routes are neces-sary to reach the summits of these tremendous chiffs and osemite like domes almost none of which have been ascended Viewing the Great Lemple from all sides, one finds it promising only from S. ringdale and, on one of the warmest days known to the region, I found myself far up its heated chifs. Here was a magnificent view of far up it a heated chiffs. Here was a magnificent view of the valler, sinuted in richest browns and reds and en-livened by bright green along the river. Far across the intervening heights were the upper reaches of the Par-unuvear and distant purple capes and headlands lead-ing to the Grand (a non on if he clorated An insuffi-cient supply of water finally forced my retreat to the river 1by far the finest effects in Tonic Carpons are seen at

et and at sunrise Then the great sandstone walls which surround one glow with the most exquisite and unusual colors and one lingers long in worshipful silence

Brown and rod are the cliffs. while above they are cherry and white elsewhere there are mag-enta spaces and lavers of amouth enta spaces and lavers of amouth fresh chocolate seeming as if they were but newly cut Where streams have fallen, the cliffs are seamed with black. But most beautiful of all are the rosy panks which liven the walls, or mingle delicately with the white More rurely there are golden-yellows crowning the white, and complet-ing a color harmony of which one never tires

Awakened in the cool of the morning by the sweet voices of birds, one may gase upward a couple of thousand feet from the Wylie Camp to the summit of a tree-fraged precipies that seems almost to overhang one Proamost 10 everning one Pro-ceeding up the valley one is con-tinually impressed with the amas-ing architecture and sculpturing of the Canyon walls and giant or the Canyon walls and grant buttes. The besuty of the Gothic cathedral is on every hand Here are insistence amphitheatres with coloned buttressee, wast dome-shaped mountains recessed

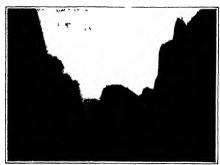

Looking south from the eastern rim of Zien Canyon

with crypts where the rook has shalled of, and Insumerable towers and mires shimmering in pills and in purple. Giant bosses of releved rook overhang royal crobes, and cropped to the complex of the control of the complex face of one greats that is a rectangular decreway, probably 50 feet in hughly which reaemble the entrance to an Expression to the control of the c

The aye, is never weary, for the varied or grosses of the canvon floor of ore pleasing, grosses of the canvon floor of ore pleasing, grosses of the canvon floor of ore present if it embroelsceed with was and yellow columbines. At Cable Mountain are two, 2700-foot wires which bring down lumber into the valley from the forest on the summit Until recently one might make a rs id and rather thillings assents of the mountain by clingmap to the sing on which the timber is severed. One of the most comprehensive views of this

region from above is at 1 let's Font, which is reached by dishibing out of the canyon from the base of Calle Mountain. On the ascent one pusses through a narrow agree with overhanging wells of great beight, and afterward views a mountain of cross-bedded sandstone laid thic figures on a cake I have forced my way up several summits in the wild unmapped country cent of the easyon rins, finding ample overrise, but no water

the easyon rim, finding ample exerines, but no water At Ras intery Bend the river loops between preciations walls and great domes. These are not varied, for below are 3,000 feet of bright red Trassion sandstone while above there is almost the same thickness of white Jurianus and the same sandstone. This in turn is often topped with pink as the bases of the cliffs, for the rushing river has long since taken it away. Down the face of a 2005-foot-fiffs tim waterfall glistens white in the sunlight. Pausing on the cliffs, and the leading 1,000 feet in the wind, it is torn to ribands, and reaches the valley in colored must love and the same than a way toward the distant heathts. Jollowing is the stream in horselock between walls one of 500 feet high that right narrow until the walls of the cliffs.

To the west of Zon Caryon and over 3 000 feet above it, lies the Colo Plateau Probably vasted as yet by less than a core of travellers, it will eventually attract many who seet the finest caryon scenery that Nature has to ofer When I am asted to compare one mountain about the contract of the compare one mountain appeal to the lover of the beautiful and the grand in assure. But when I seek the mountains for my season, I do not feel it has really the compared to the track of the compared to the contract of 

Great Temple, an imposing spot in this remote region

which I am acquainted Consequently I classify scenery according to the grandour of its appeal as primary or secondary I do not attent to compare 7 ann 6 an on and those soon from the Colob Plate in with the Crand Canyon of the Colorado I hes are dissuming in scale but they are each of primary spiral Studying either one does not deaden the thirm of the other.

one was not account the literal of the other care many of the Porte Patters with a loverfol at 10 in the west is a trip of 35 to 40 miles over some of the roughest road of the way is develodly up hill and it we has trip of 35 to 40 miles over some of the roughest road the way is develodly up hill and it we has firmt to enjoy the distant wew of pink and it viringlish in difficult and jury le mountains. ### Mending Rail Ends

INSTIAD of cutting off and disarding the wors ends of rails out railrout in the United Stata welfas them into shape again by the unvaictifene process from 1 churry lat 1917 to Max 4d 1918, the ends of a 240 rails in the main line were built up in this manner at a cost of 15 cents jer rail-soul. The material wed is steel obtained from rails, this makes a better lond than the role auxily supplied for coverace/post-state factory failures being few most exceeding two or three per cut.

The view from Colob Plateau, looking northeast toward Elen Canyon

Approach to Zien from the Rio Virgin; Smithsonian Butte in the center

### The New Service Flag

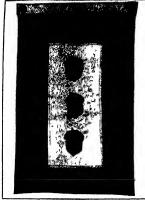

THIC use of a national service flag to honor the mon in our army and many was a very happy thought as was attested by the wide spread and practically universal see of this flag throughout the country although it was in no sense an official flag. I very home which could boost of ablue star was prid. I called the flag in the studies Committed Com

excuse to binu them is way.

A new Hap, how recently impraired which a few companies are displaying. This is a flag which means far more to the company than the former service flag. It is exactly like the old flag except that the blue stars are replaced with khabi, worns. These acoris represent the returned men who have been rematated in their former prostions. A manufacturer can point with far more prick to a flag of this sort than to the old service flag because the new flag is not an innouncement of the fast that he is making good to the near who were drafted into the service whereas the old lag merely represented the handi ap which he had to indure when the men were taken away from him and quiging by the reluctance of so many companies to reinstate their former employes this handicap was not very rate.

### Ehminating Static Electricity in Printing and Weaving

Ohl would hardly connect the work of Thales a Crick philosopher who lived seven contures before Chirat with the most motion in thiod of eliminating actual electricity from 1 per bing printed or loth being word. It it is the principle deserved by hales and understood by Franklin and all his successors in described as ance that like kindes of their current report and other and unlike kinds after at can bother that is the base of the control of the control of the control of their current to the control of the cont

The new re-employment flag

instance in printing on paper and in weaving doths Vidue electricity set up in the abot of paper going through a printing press reduces the output of the press and therefore increases the cost of the printing, because the sheets adhere to the press rolls and to other sheets of paper thereby requiring more handling and a greater time to print any given number of shorts especially when both actes of the about are to be printed. "Smillarly should be about the contract of the printed contract charged with like currents are repelled from each other, resulting in a rough for silver and as unevery year.

The neutralizer shown oradicates these troubles by providing an alternating charge in a conductor placed near the material Whatever charge there is in the material causes the opposite kind to be absorted out of the alternating charge, effecting a neutralization that leaves the material without any charge at all. The neutralizer supplies the alternating charge by

The neutraliser supplies the alternating charge by means of a small motor generator intring out an alternating current of about To-volt pressure. This in turn is passed through a transformer where it becomes a current of high pressure and small quantity ready for delivery to the paper or eloth through a row of metal points anchosed in porcelain blocks marie of the inductor.

her shown Each point delivers a change of the control of the contr

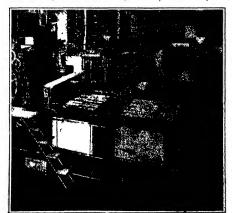

### Grading Small Coal by Air Currents

A PATENTED unspraining appearatus for restairing the dust and fines from the small coed passing pip the washed to the sand these from the small coed passing pip the washed the restaining the coefficient washing the removal of the dust before passing the coal to the washing boxes is absolutely passing the coal to the washing boxes is absolutely necessary, as not only does the dust foul the efficient water, but even when it has been recovered in the form of surry its drainage boxones a serious proposition, so much so, indeed, that at many colliers so entirely a made to wash the dust, which is taken out by a proliminary screening, and then fed in a dry state to the washed only passing to the storage bunker at the creeze. The contraction of the storage to the state of the creeze that the storage that the creeze washed only passing to the storage bunker at the creeze washed to the storage washed to the storage bunker at the creeze washed to the storage washed to

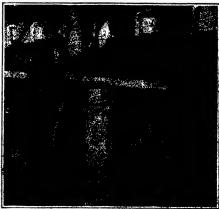

tional dass and mass will be made by passing the effyce over a screen, whatever type that screen may be. The grading of fine coal by means of a powerful current of are it sterefore an interesting departure, which may well have considerable possibilities, especially as the dust stace out by when method will be sommartively free from substances of higher specific gravity than coal.

that only one of the country colliery where a grading plant has comply been untailed by the company fibe coal is dislivered to the washery by a bucket slewator, and dislivered to the washery by a bucket slewator, and dislivered to shaking accesses. The grading appearant is fixed immediately under the delivary shate of the elevator, the nuxel coal allowed to flow over a highed were plate immediately under the plate is an orifice through which a powerful current of air is drawn by means of a centrifugal fan. The sase of the opening is through the control of 
into briquettes

The alternative methods of feeding the fine coal,
arther dry or in the form of slurry, on to the washed
coal are at best dunney and unastisfactory. Assuming,
as indeed is often the case that the whole of the fines
made as used for steam-resump at the works (in which
case they can only be fired in the form of semi-wet
slurry) their increased steam-rasing capacity of fixed in
the form of briquettes would fully justify the initial
capital outlay on the solan:

# The Giant Blacksmith who works for the world

BILLINGS & SPENCER forging is hand wrought as truly as the horseshoe on the blacksmith's anvil

147

But modern science uses, instead of the hand hammer, a great drop hammer which crashes a ton blow down on the white hot steel, again and again, with stupendous force until the forging is perfected

Instead of the approximate exactness of anvil forging, Billings & Spencer first cuts a master die out of solid steel—and it is the exact form of that die, gripped in the de scending ram of the hammer which gives every forging shape—which makes every forging exact to the hair's breadth of an inch—which gives every forging such strength as only a Titanic blow can attain

All the care of hand work—with greater exactness All the care of hand work—with the economy of modern quantity production All the care of hand work—with half a century of knowledge, half a century of supremacy

That is why a giant blacksmith has come into being who now works for the entire world

In all the days since the Civil War, Billings & Spencer forgings have been making possible great industrial achievements, have been taking their part in industry's steel skeleton all the world over

It very Triangle B product is the expression of the Billings & Spencer creed, "Into every forging goes our entire reputation

### Climbing Mt. Wilson with a Tractor

A IRACTOR built by a western con errn has performed the feat of ascending Mt Wilson and it is said that this is the first time a trict of has climbed a mountain in southern California a mointain in southern Camorina. In regular road was followed and the machine was litted with ruller fixed wheels, more for the protection of the roadway than anything cle

A stock tractor rated at 10.15 bors

power was used and a h vy load was pulled all the way the trailer and its load wrighed 3 063 pounds. The total dis-tance was 3½ miles at d the time required for the trip was 2 hours 41 minutes run was made on high genr all the way. and the only stop was one of two minutes duration to allow an automobile to pass in a narrow place. At no time was there any overheating of the engine or trouble of any other sort this good result was naturally to be experted in a machine built for heavy hailing and continuous lard work the fuel used was distillate, though the tractor was built to use kcrosene, the quantity consumed was a trifle more than five gallons. Only one pint of water was lost in the cooling

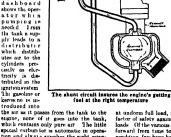

### Non-Electric Starter for Trucks and Tractors

R EASONS for applying starters to motor truck and tractor engines are plenty and sound. The engines are usually big and of heavy construction and difficult, in cold weather, to turn over rapidly, for, in addition to the weight of the parts and the normal internal friction, the oil is thick and heavy and on the get warm a good deal sooner than the engine. There has apparently been hesi-tation about installing electric starters. in these working automatives and though here and there it is done it is so seldom that electric starters are rare except, currously enough, on the smaller trucks where they are least needed

A starter that does not employ electricity, and which has been installed the past six or seven years in many motor boats and airplance in addition to passenger cars, has recently been devel-oped in a form suitable for heavy truck and tractor engines. The principle of operation is simple and direct. Air at high pressure mixed with sufficient gasoline or keroseno vapor to form an explosivo mixture is admitted to the cylinders of the engine, each evlinder getting its charge of air just as the piston s about to start downward on the expansion stroke at which time both intake and exhaust valves are closed Thus th cugane is mad to run much as a steam the eighters much to run much as a steam chaine is run. After a revolution or two, however, the spark occurring in the regular way ignites the mixture and the engine starts and runs and continues to

Air is compressed by a small air pump with a single cylinder which is driven in precisely the same way that a magneto is driven or a water pump or an electric generator. A hand operated clutch is used to throw the pump in or out of gear The air is delivered to a small receiver in which it is stored at a pressure of 250 pounds maximum. The tank has suffipounds maximum. In tank has sufficient capacity to start an engine of average size about fifteen times which will bring the pressure down to about 100 pounds. To restore the pressure to maximum again requires about 41/2

minites pump ing to restore the pressure to in timum nfti i ene start the start in put back into volume of air required for one Sturte consumes about half a minute A pressure gage on the shows the oper-ator when pumping is needed lrom needed 1 rom ply leads to a which distributes air to the cylinders pretricity is distributed in the ignitionaystem The gasoline or

engine, none of it goes into the tank, special carburiter is automatic in operation and always supplies the right quan-tity regardless of the pressure of the air The air pump and distributer are mounted as a unit and together are no larger than

a good sized magneto. The whole of the starting equipment, imituding pump, distributer, clutch tank, piping and all smaller parts weighs about 50 pounds Lubrication is automatic throughout

### An Adjustable Circuit for Low-Grade

Tis concoded that with a constant load kerosene and other cheap fuels would be wholly practicable, but unfortunately, loads are not constant. The ever changing character of the instantaneous demands that the engine is called upon to meet has made the use of kerosene difficult on account of the lack of volatility Being a heavier oil than gasoline, and less

at uniform full load in order to afford a factor of safety against the sudden over-loads. Of the various suggestions brought forward from time to time to meet this condition few have been simpler than the one illustrated herewith

It involves the use of the exhaust to heat the mixture when extra heat is necessary But this is not necessary at all times and when it is not necessary, it would be a disadvantage to have mixture too hot bo an automatic shortmixture too hot so an automatic suor-circuiting arrangement is provided, whereby the mixture circulates past the exhaust when it needs the heat from the exhaust and steers a careful course clear of the exhaust when it does not need that

I his is accomplished by means of a shunt operated from the throttle, as the diagram makes clear Ordinarily the short path from the carburator to the cylinders is open, and the mixture takes it. But when the overload comes, and it is desired that the mixture pass through a heat treatment before reaching the

hable to remain when any in-ducement is offered it to condense, when an especially heavy load denly the kerosene is apt to temperature for the moment is insufficient to keep it in vap-orised condi-tion, and this means that the engine is going to stall

The only remedy as some means of insuring that the mixture shall get the proper amount of host at all times At variable load it must

culinders, the valve is closed from the olinders, the valve is closed from the throttle, and the gas follows the state shown by the arrows in the associal part of the diagram. On this curvell lies a heating chamber warmed by the ex-haust, so when it is diverted over this path, the mixture gets the desired besting. The manufacturers say that long and severe tests have demonstrated the com-plete practicability of their device; that with its use, the engine will run on any kind of a mixture, which need not be studied carefully and need not even be uniform, that even when the engine is more or less out of turn the shunt as so adaptable to conditions that good results be obtained It is to be understood that the shunt is not designed to get an from the necessity of using gasoline for starting—that problem is left to some future investigator. But we are asked to accept this device as an answer to the objection that low grade fuels in a high grade engine give irregular operation

### Finishing Crankshafts

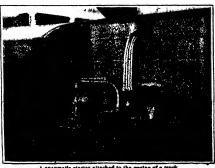

A STRIKING indication of the extent to which specialisation is carried in the automotive industry is found in the fact that in Detroit, the City of Automofact that in Detroit, the City of Automo-biles, there is a large plant that does noth-ing whatever but finish erankabafts. It does not make any erankabafts. Bough forgings are received for shafts for air-plane, automobile, truck, tractor and stationary engines, and those are turner, ground, polished drilled for oil passages, threaded and otherwise made completely ready for untalkation in anomae. ready for installation in engines.

All such work is done to the specificathe state of the circumstances that customers will be exceed-ingly strict in their demands for accurate and correct work and, this being the case, the crankshaft finishing concern has found it necessary to establish a system of gaging, inspecting and checking that is remarkable for its completeness and its working efficiency A crankshaft that is not perfect cannot be delivered because is a a foregone conclusion that it will be-returned as not coming up to specifica-tions, and it will, therefore, represent a dead loss to the finisher—a loss that may be complete, if the shaft is undersuse, or partial if the defect can be remedied by further operations it is a foregone conclusion that it will be

### **Bull Gear Drive Housing**

PROBABLY the most widely used final drive for tractors is the socalled "bull gear" system, in which large gears mounted on the driving wheels or the rear axle are driven by pinions on the final shaft of the transmission. The system has the drawback, however, that it is difficult to protect from dust, leaving the gear teeth open to destructive wear

A western inventor has devised an in-genious housing which completely covers genious housing which compisitely covers the buil gears and pissons and provides favorable operating conditions tending to greatly morease endurance and naturally decrease loss of power The wheel nub used is of special construction, with a cast wheel fiange to take the buil gear and other fianges to take the inner gear and other finances to take the inner eads of the spokes, sufficient metal being provided between the inner spoke finance and the gear finance to take the testion stresses. A easing, preferably of light but strong sheet sized, is readly placed over the rear, dust washers of Felt or other suitable material arring to make tight the joints at the axis on one side and the hub on the other. and the hub on the other.

### Letters from Manufacturers

THE Reconstruction I ditor has remanufacturers calling for inventious which might prove profitable to manu-facture. Several of these letters are facture Several of these letters are published herewith. The names of the manufacturers are not given but the letters are numbered and inventors who reply to them should designate by number to which particular letter their replies are directed

We shall be very glad to have you advose us of any matury that you may receive for work in our line

We have a machine shop equipment consisting of some 205 in chaines of various types and classes including planers father millers shapers guinders engraving machines drill presses etc

We are a well established corporation located to a New England scab ard city and engaged in working sheet metals. We are desirous a securing new lines of prohiable business. Only propositions promising steady development will be onsidered Communications drawings data etc will be hell as strictly con-

Many good patents are worked out by men who lack facilities fr properly developing, manufacturing and selling the results of their inventions. This letter is to solicit your cooperation

in having those of your resders com-municate with us, who have inventions that could be made in a factory such as

We have a modern plant completely equipped with machinery, especially selected to produce a variety of articles

The Lelitor is ancrown to help manufacturers who have talk machinery on their hands during this reconstruction period, and who are looking for now arricles auticles for them to manufacturer. I would be the substitution of the substitution of the substitution with the hir of work adapted to their machinery, and from insention, such that the sature of the decree they has to offer Insentions, with working cavity did not support to send complete information about their viscentions, with working own in an article of the substitution of the substitution of the substitution of the substitution of the deliter out forward that makerial to manufacturers who are interested. The actions will forward that makerial to manufacturers who are interested.

both stamped and as-sembled—in sheet metals up to 10-gage in thickness we also maintain a retinning plant and baked cramel inshing plant where we apply plan councils reproductions of beautiful wood grainings or ornamental

Our staff of engineers has had many years of as applied to a variety of industries while our selling organization blankets the entire country If any of your realers

are seeking a manu-facturing and sales connection we shall be pleased to have them communicate with us with a view of taking under consideration prac-

Heat regulating attachment for stoves

Our present line con-sists of lathe and drill chucks, boder and radiator chaplets and nipples, electrical outlet boxes, locknuts bushings, ferrules, metal stam; ings and drawings for the information of those not conversant with the mahinery necessary to turn out the above products in large quantities, we would state that our

mechanical equipment consists of the following Lathes, drill presses, milling machines, grinders, etc. Batteries of blanking, punching and drawing pressos an-nealing and enameling ovens, tapping machines In addition we are operating large electro-galvanising and copper plating outlits. To sum

up, we can make

any article of any

metal whose con

struction in-

heavier than 12-gage material.

A large part of our plant is now idle on account of the completion of government con-tracts and we she wire to take, on so me' patented, whose construc-

es stampings or drawings, not heavier than 12equipment of our type. We might seld, however, that we are prepared to spend whatever sum necessary to buy additional or different equipment, abould the inves-tion possess commercial possibilities selde

This company has been doing business for over a quarter of a century and we believe the reputation we have busin up will be a distinct asset to any propos-

we might go into

We are in a position to go ahead immediately, correspondence on the subject will receive most prompt considera-

### Letters from Inventors

THE Editor has received a great many letters from inventors, coveri wide range, and wherever possible three have been referred to manufacturers who might be interested in them. Some devices do not seem to fit any of the re-quirements so far specified A few of these are published herewith in the kept that they may appeal to some instan-facturer who has not yet written to the Reconstruction Editor

### [Heat-Regulating Attacks

To overcome the disadvantage of having to turn the draft dampers on and off frequently, an inventor has devised a simple heat-regulating attachment, den-sisting of a sheet metal device in which is sisting of a sheet metal device in wheen is placed a damper that is normally held open by gravity. As the stove growshot, the draft passing through the devices increased and this tends to swing the damper into a closed position, as indicated by dotted hines in the sectional

### Snow Attachment for Autom

In order to make an automobile of in order to make an automotion or service in deep snow, an inventor has provided a set of runners adapted to carry the weight of the machine. These runners are flexible and can be flexed by runners are flexible and can be flexed by the ordinary steering wheel to guide the machine. To proped the machine, the tree of the rear wheels are removed and in their place steel bands are made fast, these bands being provided with hooked-projecting members that grip the snow or nor These hooks are flexible so that they will pass under the wheel set tecopies. wheel as it revolves

. Two callpars that save time in the

On December 7, 1918, the Allen Property Custodian of the United States sold the entire holdings of the Bosch Magneto Company which have been taken over by an Areican Manufacturing Corporation. The Terronnel was submitted to the Custodian before sale.

THE history of the development of the Internal Combustion Motor is the history of Bosch Ignition. The Bosch is now an American Institution which will necessarily maintain the same scrupulous care in the purchase of materials, the same exact precision which has marked its every manufacturing process and the same exhaustive laboratory and field experimentation which has kept Bosch Ignition in step, without interruption, stride for stride with the motor progress of the world.

There has never been any manufactured article whose reputation for satisfactory performance has been better than the Bosch.

After America entered the war, thousands of Bosch Magnetos—85% of the entire output of the great Bosch works at Springfield—went into vital war service on army trucks, tractors, airplanes, motorcycles, etc.

Bosch now is new only in ownership—it comprises the same active heads that administered the company under the Alien Property Custodian during the war. The Bosch Organization, which from the first has dominated the field of Ignition, enters upon a new era of service to American Industry. Motor triumphs of the future, as of the past, will be built on the firm foundation of Bosch Ignition.

is made in various forms for every manufacturing purpose. If you have a troublesome belting problem, one of our men can help you solve it, and there is a Jewell belt to keep it solved

We have dealers at convenient points to supply your needs promptly, and correspondence to this end is invited.

#### The Current Supplement

ONE of the intenseting problems before the conference at Paris is the dis-position of the German colonial possessions. Sense of those were islands in the Pacific, and with an understanding of German plans for world domination, issue come an expensition of the stress come an plans for world domination has come as appreciation of the strategic importance of these shands as well as their commercial value. This knowledge has aroused considerable, attention in England Deceause of the bearing of the matter on the very un-portain unterests of their native on the very unitered to the state of the problems survoived from a British point of vive, will be found in an article on The Islands of the Pacific in the ourrent issue of the his instructive Assentials Shirt-assestic of the his instructive Assentials Shirt-assestic. of the Scientific American Superment No 2250 for February 15th which con-siders their present state and future im-portance. This is a matter of importance to our country as well as to England both from a commercial and a political stand-point. It seems strange that there should point It seems strange that there should be any part of our country that m not perfectly well known to all of our people by this time but such is the fact The tory of (anyon de Chelly tells of one such locality of considerable attraction both for the archaeologist and the tourist and is accompanied by a number of attractive photographs in How Plonts and Annals Utilize Color a distinguished Franch Utilize (olor a distinguished French naturalist discusses various pigments that protect living matter against radiations Pushing by Machinery tells how the great salmon fishing industries of the Pa coast gather their harvest from the sea, and a number of illustrations show the natur of the apparatus employed The lustrated paper on The Detection of Gh in Prisms in concluded Hying commices the question in relation to meteorological observations

### Absence of Frenks at the Automobile

MPROVISED as the recent Automobile Show may have been, it was one of the most successful ever held. The exhibits were numerous and varied although the novelties and oddsties which generally add color to such an exposition were noticeally lacking. Considered as a were noticeally lacking. Considered as a whole the models shown followed closely the lines of a year or more ago, for it is quite obvious that during the past 18 months the aut mobile designers and manufacturers with their whole energies directed toward producing war materials have had little time to devote to untried changes in motor car construction So they have generally made the present models follow the tried and proved lines of a year ago with here and there a slight

suppressed In other words the pressure of war work has made us a very practical people during the past months of such

effort our time, myn tor efforte on the Liberty and other engines have developed little of the passenger out, for the reason machines and the second second machines depict their similis ance One is a constant spewhile the other is a variable spet The conditions of operation additional

However, if the pa nowever, it the peasurger car am peasure gained much by the war experience of its darigners and builders, the motor trush has gained—and gained a lot. The wast demands of the American Army transport service oreated tens of thousands or money trucks. In meeting the rigid requirements of military service, and in the standardisa-tion of numerous features of design, the motor truck manufacturers have gained invaluable experience which is already reflected in many of the season's offering

#### Some Non-Poisonous Gases and Their Uses

(Continued from page 148)

as 0.00952 and helium as 0 131 It gives satisfactory bouyancy, therefore, and now that we shall have helium available at a commercial price we may expect many uses for it to be discovered, although a supply for dirigibles is not yet in sight.
Then should it be found through this work of securing belium that a method for preducing pure oxygen chemply enough for commercial application has been evolved we will have another reagent of great potentialities. There are some reactions potentialities. There are some reactions requiring the beat of the electric are distinctly and the might be carried out using corygen, when might be carried out using corygen, where electricity is not available or its might prove better technical practice. It is not known just what would be the result if he temperature of the blast furnace sculd be sailed a few date. lew degrees by the use of oxygen, but is might well be that a beneficial revision of methods would take place.

#### Uses of Oxygen

In the gas industry oxygen would make it possible to use inferior fuel in producers and furnaces by enriching the air and it is ften used to melt through stoppages in blast furnaces Oxygen is an aid to varnish manufacturers while its use with acetylene is becoming as widespread as with hydrois becoming as wirespread as wire nyur-gen for autogenous welding and cutting because of the higher temperature attain-able and hence the increased speed of working To cut a manhole in an average boiler takes the effort of two men for seven a year ago with nex and there a sught boder taker the effort of two ness for seven in fact the outstanding feature of this greams is Viv York Automobile Show is the also shirt al senior of freshabi inventions. # Multiplexing the Telephone

Marvel has followed marvel ance Alexander Graham Bell invented his first simple telephone, the forenumer of the millions in use today

In these last four decades thousands of Bell engineers have developed a system of telephonic communication, so highly perfected, that the same crude instrument which at the beginning could hardly carry speech from one room to another can now actually be heard across the continent. This is because of the many inventions and discoveries which have been applied to inter-vening switchboard, circuits and other transmitting mechanism.

The vision of the engineers has foreseen requirements for increased communication, and step by step the structure of the art has been advanced --- each advance utilizing all previous accomplishments.

No one step in advance, since the original invention, is of greater imortance, perhaps, than that which has provided the multiplex system by which five telephone conven tions are carried on today simultaneously over one toll kne circuit, or by which forty telegraphic mess can be sent over the one pair of wires. As in a composite photograph the pictures are combined, so the several voice waves minute on the current to be again separated for their various destinations.

By this wonderful developme the Bell System obtains for the pub-lic a multiplied usefulness from its long distance plant and can more speedily and completely meet the needs of a nation of telephone users.

#### o of Liquelying Air

Oxygen for commercial purposes is usually obtained by the electrolytic or the liquid air route. It may be had as a by-product from certain electrolytic cells such product from certain electricity to calls such as these making hydrogen as the primary product or where power is cheap electricity in method may be used with oxygen as the first consideration. Liquid air, which was such a favorite for lecture experiments a short time age has become of superfection time age has become of superfection to the production of pure gases. It may also be used to a limited extent for the attainment of year low temporary of the contract of the contra for the attainment of very low tempers tures especially in accentific experis often with a view to securing extreme dry-ness by freezing out the last traces of moisture

In the I inde process air is first compressed to at and then to 200 atmospheres after which impurities and moisture are removed. It is then expanded down to 40 atmospheres led through a heat inter-changer and thus cooled as returned to the compressor where 200 atmospheres pressure is again secured. This process is repeated until finally some of the air reaches a temperature at which under the pressure it becomes a liquid. I his liquid is allowed to expand in a vessel at atmospheric pressure causing great evaporation of very cold air. This is passed into the heat interchanger to cool the compressed air and about ninety minutes after the apparatus is started liquid air in excess of the requirements of the process may be drawn off Ammonia compressors used to cool the air in commercial plants and calcium chloride is a common drying

The Claude process employs lower ressures while a system of heat inter changers and an expansion engine enables the production of liquid air in a short time Low costs are thus realised but still greate economies in the use of power are claimed for the new Norton proce

for the new Norton process

With liquid air as the starting point it
would seem that the separation of gases
should be as simple as any other fractional
distillation Elaborate restification sysdistillation Elaborate restification sys-tems have been necessary however, in tems have been necessary however, in order to secure satisfactory yields and purity. The boiling point of oxygen at atmospheric pressure is -182.7°C and of mitrogen -196.8°C. Utilining this difference in boiling points modern columns have produced oxygen of 90 per cent. Of the liquefied industrial gases meatinged all are noderline averaged.

tioned all are colorless excepting oxygen which is blue, osone dark blue and air light

#### The Engineering Index

The Engineering Index

THIS compilation, published for 25
years in and by the Engineering Magoine and the successor Industrial Management and universally accepted as the
standard in its class, has been sequired
by the American Society of Mechanical
Engineers, and with hereafter be published
by the Society As hereicofore, it will be
the sum of the Society, as a separata
shoet for sipping purposes, and is an

# MAZDA is the trademark of a world-wide service to certain

lamp manufacturers. Its purnose is to collect and select acientific and practical information concerning progress and developments in the art of incandescent lamp manufacturing and to distribute this information to the companies entitled to receive this service.

MAZDA Service is centered in the Research Laboratories of the General Electric Company at Schenectady, N.Y. The mark MAZDA can appear only on lamps which meet the standards of MAZDA service. It is thus an assurance of quality. This trademark is the prop-erty of the General Electric Company.

#### The Engineering Index (Continued from page 156)

library of the Engineering Societies, which regularly receives 1,100 periodicals from all over the world, the Society has unlimited possibilities in the direction of indexing. An adequate schame of sub-head classification has already been worked nead classification has already been worked out, on a scale which makes it plain that the Index in its new dress will be as com-prehensive as could be wished by the most cosmopolitan or the most highly specialised

This undertaking affords but one more demonstration of the inherent soundness of the project which several years ago, housed all our leading engineering organihoused all our seating engineering organisations in the one Engineering Societies Building for the magnificent library which alone makes it possible to undertake an index on such a scale is, in its turn, made a possibility by the pooling of the resources of all the associated bodies

#### Electrolysis in Reinforced Concrete

THE suggestion is made by a French scientist in L Année Scientifique (Paris) that the deterioration of reinforced con-crete may be caused by spontaneous electrolysis. The theory is that dampness and chemical impurities in the water emand the minist impurious in the water em-ployed in the manufacture of the concrete give rise to a continuous flow of local cur-rents which slowly corrode the metal and, rents which slowly corrode the metal and, hittle by little cover it with a layer of oxide 1 ht metal framework thus in-creases gradually in volume, so as finally to exirt sufficient pressure to cause crack-ing and bursting. That the pressure may be very formulable is proved by the follow-ing experiment. In a steel cylinder having an insade diameter of 38 millimeters a steel rod 23 millimeters in diameter is inserted, the free space then being filled with coment The inside rod is then connected with ar electric circuit and the apparatus placed in a tub of water Under the influence of the current the rod will be oxidized and correspondingly increased in size. It will thus oxert a pressure upon the cement surrounding it which will be transmitted to the cylinder, under the influence of this pressure the cylinder will expand and the measurement of this expansion proves that the pressure exerted in a comparatively that he pressure exerted in a comparatively short time is equal to 350 kilograms (770 pounds) It is obvious that even the best cement could hardly resist such a pressure Another experiment, even more striking supports this view A column of coment do centimeters high and 150 millimeters in diameter and having an iron core running from one end to the other was plunged into water A 50-volt cur-rent was then passed through the iron core, which acted as the anode, in less than three hours the column of cement had entirely collapsed

#### Tungsten and the Steel Industry

N the steel industry a number of metals are now used which not many years ago were little known except to students of metallurgy Some of these unfamiliar metals have come into great prominence inctas have come into grate prominence during the war both on account of their being issential to the production of arms ments and munitions of war and also because of the serious problems which arose connected with their supply. Of such metals tungsten is one of the most arose connected with their supply of the most manufacture of steel having the special qualities of hardness and toughness that are required for high-speed machine though the special qualities of hardness and toughness that are required for high-speed machine tools. These steels also possess the valuable property of retaining their hardness, and hence their cutting power, even when heated to redness by the friction of the work which is being performed. The sources of supply of tungsten orse and the production of the metal cross, therefore are of interest not only to those concreted in the great metal and engineering industries, but also to those espaced in industries, but also to those espaced in contract the contract of the press metal and engineering industries, but also to those espaced in the contract of the press metal and engineering industries, but also to those espaced in the contract of the press of the contract of the press of the contract of the cont

depends on the existence of the best and most efficient tools and equipment

Tungsten sprang into prominence early in the war because of the ungent requirements for the steel industry for high six 1 ments for the steel industry for high sich machine tools and because it furmished typical example of a key industry monopolized before the war by Germany The story is now fairly well known. If refining of tungeten had been carried or almost exclusively in Garmany From the moment of the outbreak of war the estat habment of a tungsten refinery in th United Kingdom was of the utmost im portance in view of the needs of the fa tories engaged in the production of arm and munitions By cooperation among a number of the largest steel manufacturers in Great Britain this was quickly second plished and regulations were made by He Covernment for controlling the export

Burma was until 1916 the largest pro-ducer of wolfram the principal ore of tungsten Though possessing the richesi tungsten-ore deposits in the world Burma has been handicapped by crude methods of mining and treatment of the ore and by primitive means of transportation mprovements in those matters, however

ave been made recently The keen demand for tungaten led to a romarkable display of energy in the United States in prospecting for new occurrence of ore and in develoying existing deposits in this country. The result is that the United States has outstripped Burms in ore production during the last two years and has also become a considerable ex-porter of tungsten metal and forro-tungsten alloy to steel-manufacturing countries taken place in Japan in Portugal (where the thief producer is a British (ompany) and in Argentina Bolivis and Peru Stimu lated by high prices mining of these ores in the three last-mentioned countries has rapidly extended during the past thro-years the output being shipped chiefly to the United States

Australia is second in importance among British territories producing tungsten ores In Queensland many of the principal mine have quite recently been acquired by one of the largest of the concerns which have established tungsten reduction plants in Great Britain since the war and the event appears to promise a new era of progress for this branch of mining in Queensland Wolfram is mined in New South Wales and Victoria while important quantities of scheelite another ore of tungsten are obtained in New Zealand and in Tasmania Wolfram is also obtained as a by-product of the Cornish tin industry and has received special attention during the last four years (anada has become a pro-ducer, chiefly of scheelite mined in Halifax County Nova Scotia and deposits are also known in Rhodesia

It is difficult to foresse the future tungsten and we do not propose to make any prediction but it is worth while to examine the considerations which would lead one to form an opinion It would be optimistic to expect a continuance of the cages demand and name one prices reassed at times during the past four years. If a general commercial depression and a fall in the world's demand for steel were to take place, tungsten would suffer as would in the works demand for steel were to take piece, tangeted would safe as would many other commodities. On the other hand activity in the works steel fracte and has a we arrect to witness in the future for some time to come should support the position to tangeter a steel handle steel the position to tangeter a steel handle would seen to be established for the present. The possibility pay also be formed in mind that the results of estantific results and the steel steel 
#### WILLIAMS' SUPERIOR DROP-FORGINGS AND DROP-FORGED TOOLS

### If the great war had been fought in George Washington's time

Of all the military problems that confronted George Washington there was none greater than that of feeding his arimes

Meat the highting man's most important ration then as now was especially hard to obtain. Much of the time his voldiers had to depend for sustenance on what they could get by foraging

America s job of meat supply in the great war just ended war a thousand fold bugger than Washinations. It was a job of feeding not only our own huge forces here and shroad but the Allied armies as well

America succeeded because she had at her command what Washington didn't have—thousands of prosperous farms and centralized large-scale organizations like that of Swift & Company for the production and distribution of meal

How well America succeeded how well her meat machinery stool the test, is evidenced by a French military authority who not only said that France could not have held out without our support but asserted that the men over there in the French trenches are the best fed men in Europe

To give some idea of the immensity of the food problem—Swift & Company one single month shipped 2012 carloads of provisions overseas valued at

If America had been dependent on the meat supply methods of Washington's time or even of Civil War time it is not difficult to imagine what would have happened

Speaking along this line an American official and that it would have been a super human task to gether and handle the meat meessary to feed the people during this great war if conditions had been the same as they were during the Civil War when the meat industry was scattered all over the country

The only Refill Shaving Stick

# "like putting a new battery in a flash-light"

When you use Colgate's Handy Gnp Shaving Stick ou can renew the soap as easily as you replace the worn-out battery in a flash-light. It is made to be used that way—for convenience and economy

You will notice that the "socket" of the Handy Grip is threaded. When your soap is nearly gone, get a Colgate Refill" Stick, which costs less than a complete Grip and is threaded to fit the socket. Unscrew the last of the soap (using a knife-blade like a screw-driver) and screw in the "Refill". Then add still another economy by sticking the unscrewed stub on the end of the "Refill"—there are 50 cool, comfortable Colgate shaves saused that way

NEW YORK

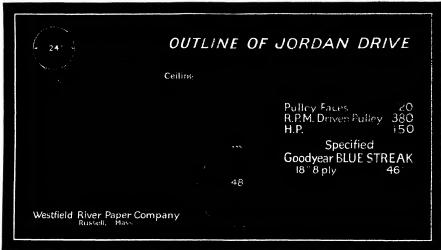

COLGATE 6° CO Established 1806

The Shaving Stick is the economical way to make a satisfactory lather. We can give you impartial advice because we make Shaving Sticks,

# That Extra-Power Jordan—and the G.T. M.'s Extra Ply

Even very good belts had proved to be trouble-peddlers on a certain Jordan It was in the Westfield River Paper Company plant at Russell Mass Some of the belts pulled out at the fasten ings and lacings all of them stretched none of them delivered the horsepower needed for that particular Jordan

One day a G T M—our Mr Leddy—called on the plant superintendent and explained the Goodyear plan of selling belts according to prescription instead of as a hardware man sells nails. He was asked what he could do for that Jordan drive He asked to see it and found that it required 150 horsepower instead of the usual 75 to 100 on Jordans. He asked questions and found that it had been built to do a special amount of hard work that neffic ent belts kept it from doing. The G T M made his measurements and started to fogure.

He knew that an 18 inch belt ordinarily should not have more than six plies but in this particular case since the smaller pulley ran at a comparatively slow speed he saw that he could with perfect safety apply an 18-inch 8 ply belt which would do the necessary work Particularly so since the Blue Streak Belt possessed the required flexibility to permit the extra ply under the existing conditions.

Mr Leddy got the order and the belt was applied May 5 1917
There has not been any trouble on that drive since—although the belt has been working 24 hours every day

Mr Dozier, the plant superintendent, says that that belt is delivering more power than any belt he ever had. He thinks that its excellence is largely due to the friction surface that every Blue. Streak user knows so well. But he admits that most is due to the G T M—to the prompt and accurate way in which his disgnosis of this troublesome drive was made and the correct remedy figured out. So he has had a G T M make a plant analysis covering every drive in the plant and he now orders according to its prescriptions whenever an old belt wears out.

If you have a hard drive that makes belts you always thought respectable act like trouble peddlers, ask a GT M. to call One from the nearest Goodyear Branch will be glad to do so when next he is in your vicinity. His services are free—for the savings he effects for purchasers are so evident and material that a gratifying volume from the plants served is sure to result within a few years.

And when the G T M. calls ask him about how another G.T M
—our Mr DeVerges—saved \$347 98 on a single drive, for the
Planter & Lumber Company of Jeanerette La., and how a G.T M.
—our Mr Heehs—made \$100 do the work of \$300 on a sidehead drive in another plant.

A grade for each type of service

VACUUM OIL COMPANY and Softward little and the second finance of Little NEW YORK, U. S. A.

Setting a Candle to Catch a Thief

OUTSIDE air that filters through the brick-enclosing walls of boilers costs industrial America many thousands of dollars each year because such leakage cools' the fire kills draft and therefore wastes coal to the extent of thousands of tons in the national aggregate.

Yet just as the detection of such leaks is easy (see note under ticture) so is the remedy simple but it is simple largely through the pioneer work of Johns Manville in its practical contributions to boiler furnace improvement

Through a complete line of products listed below Johns Manville can assure plants of new standards of heat saving in the boiler room standards that met and satisfied the Government during the coal crisis just past when tons of fuel were saved and many hours of shut downs averted-at a consequent increase in factory production

Seldom has conservation been better served by Johns-Manville than in this branch of its service

And it can be predicted that the products listed below and the expert knowledge of their application will be of as great service to the nation in this present period of post war readjustment as they were during the war

Because to the progressive plant, conservation has become permanently a national obligation, as well as a business expedient

H W JOHNS MANVILLE CO New York City 10 Factories Branches n 61 Large Cities

These Johns-Manville Products save fuel in boiler-rooms

High Temperature (Refractory) Cements for boiler settings Aertie Builer Wall Cast ng for boiler wall

salithic Baffie Walls—tight durable easy to install; prevent short circuit ng of hot

Through \_\_ sbestos

and its allied products INSULATION CEMENTS

This smell device wes the testing apparatus lest year in hundreds of boiler-rooms at a time when cost say ing was a vital war necessity

Thousands of tons of cost have been saved by prevanting bollar wall leak age and by similar corrective mea sures at and eround the boller furnace

A complete service in this department of engineering was one of the impor-tent contributions made by Johns Manville during the fuel crisis

A coal loading and unloading bridge of unusual size and capacity

#### Huge Bridge to Facilitate Coal Handling

THERE was only one way for the industries to counteract the shortage of labor which has been hifting them
so hard during the last few years. That was to dis
cover a methanical equipment that would take the place
of human labor. Almost any inventor who had a scheme that showed signs of being practical had a chance of trial and many devices were brought to light that might otherwise have remained obscure for years

The large essential industries were of course hit the hardest for the demand from the public was insistent while the increased demand to supply the arm s kept

them working at high pressure all time. This was especially true of the coal mine operators who seemed to be hampered at every turn. Here was shortage of labor in the mine shortage. snortage of more in the limit shortage of labor for loading and unloading and finally a shortage of cars. A coal company at Alicia Pa, installed a large and coatly device which helped in this prob lom doing away with a large percin tage of the former labor and doing the work in much less time

the work in much less time. From the mine the coal is brought down the Menongahela in barges and by means of this bridge is unleaded either to a storage yard or direct to the care. The bridge is 455 feet long with a 674 oot cantilever extending out over the river. On the bank at the opposite use of the bridge run the railroad tracks. and cars can be run up close under the the structure At this end of the bridge is the screening equipment so that the coal can be sorted out and shipped in uniform size. The bridge is 110 feet high to the trolley rail makof 55 feet as compared with 3't 40 feet the usual hight of a storage pile. This gives a storage capacity of 301 tons per head foot of do k.

The hoisting is done by a 6 for clam shell bucket with

a pe od of 220 feet per minut with full ad The trolley travel is 1000 feet per minut and the brade 100 feet per minut per minute. The motor c jupic et includes a 2.5 lorge-power motor for hoisting a Holora [wire into I of trolley travel and a 100-liors; pe wit motor for moving the bridge on its runway

To facilitate further the 1 iding a tunnel has been built under the storage yard and a raircud track runs into the tunnel He are are loaded in this tunnel from the cont piles above threigh gates operated by hand from the top of the cars. This increases the loading caractty of the plant as cars can be loaded from under muth while the clam shell tucket operates from above With this storage space mine operators will not be delayed by a scarcity of cars while the quil loading and unliading methods will do away with any congestion of cars at the dock waiting to be filled.
Loading and unlighting bridges are of course by no

means a novelty S mething of the sort is to be found at all large min's and at many shipping and storage pois But the one is a described

stands almost in a class by itself

#### Oil Pipe Line Across Scotland

Till British Covernment has jist completed an eight inch pipe line a ress Scitland. It is rejected that the line was constrained for the jurgos of securing a intinuou adequate supply of full fir the Butish navy with a minimum risk of inteference from

minimum risk of intelerence from on two minimum.

Incline fill we the course of the Clyde and I ith Cunal the starting point being at Old Kilpatrick on the cutskints of Glass, by and the terminal at Changemouth.

Il re are two intermediate | imp mg stations and it has been estimated that fuel cal can be pumped in a cld stat at the rate of 100 tons per hear At the OH kilpatrick terminal 16 large tanks have been constructed on high ing 8 000 tons of oil. At the oth rend the oil is pumped into large reservoirs easily accessible to oil burning steamers at Grangemouth and the Forth ports

The leading tunnel for railroad cars—an unusual feature of the coal yard

#### The Merchant Marine Problem

OR many years past we have been an carnest idy state of an enlarged merchant marine-a muchant marine that should be enumensurate with the great and over growing sea borne trade of the United States In common with every other advocate of a great shipping fleet, we have realized how complicated was the problem, not so much in respect of building as of operating the ships and how difficult it would be to awaken in the American people that enthusiasm for the sea which is absolutely necessary if an adequate merchant fleet is to be built and profitably run

The present revival of interest in our shipping is due to the war, and particularly to the onslaught of the German U-boats. In April 1917, when shipping was being sunk at a rate approaching one million tous a month the question of our building ships was no longer one of thores, but of the sternest necessity Not only did we have to build ships, but we had to build them quickly and to get a big fleet affoat quickly we had to select such types as lent themselves to the most rapid construction Furthermore, due to our neglect of shipbuilding we were without an army of skilled workers and we had to extemporase them. Out of these conditions sprang the wooden ship and our vast army of somiskilled shipbuilders | for you cannot make an expert shipbuilder offhand lie is a workinan whose skill comes only as the result of experience and in some branches of the work of experience spread out over a considerable period of time

Another compelling element in the problem was the necessity for doing whatever we did on a vast scale Consequently quite regardless of cost we rushed the construction of shipbuilding yards larger than any in existence—too large as we now know for permanent ernment gave to labor practically whatever wage it aske I with the result that semi skilled labor in these vards is often receiving pay that is much greater than the income of the average skille | professional man

Non- as a result of these conditions, we find ourselves with a flect of ships large in total tonnage, but very beterogeneous in its inske up. Beggars can't be choosers and with the possible loss of the war staring us in the face we had to commandeer whatever was in sight and build ships that but themselves to stand ardized and very rapid construction. Hence our increhent marine includes a whole fleet of wooden ships The official figures of the Shipbuilding Board show that the United States now owns steamer of a total of two million gross times that we are now building four million gross time and that there are two million gross tons owned by private in hviluals. This means that altogether we have a total feight million tons gross of shipping publicly and privately owned and under construction

But let us be careful here not to be misled. The world at large talks in terms of gross tonnage, a gross ton representing very much more than a deadweight ton and if we wish to have a clear idea of the relative standing of our merchant marine and that of the rest of the world we must think in terms of gross tonnage

The Department of Commerce of the United States uses gross tons, and since a steamer of 6,000 tons deadweight would be of about 4,000 tons gross, the use of "deadweight tonnage," by the Shipping Board is apt to be very misleading. As a matter of fact, our total of 12 millions in deadweight tons is equivalent to about eight millions in gross tons.

Now, with regard to the future, there is no doubt about our ability to build a great merchant marine Further-more there is no question that, if we pay sufficiently high wages and give the crews sufficiently comfortable quarters, we can adequately man every ship But when we come to the question of competing with the great outside world, the problem takes on a very different aspect, and, the prosperity of the venture, if it be left entirely to its own unsided devices, becomes very, very doubtful The only solution appears to he today, as it did ten or twenty years ago, in the granting by the United States Government of a heavy subsidy to make up the difference between the cost of running foreign competing ships and the cost of running American-built and American-operated ships

Somebody, we believe it was Mr Hurley, suggested that we write off the burden of the heavy first cost of our war merchant fleet to the extent of about one billion dollars Coming on top of Mr Daniels request for an addition to our navy which will cost another billion dollars this proposition of Mr Hurley will not be very attractive to the already overburdened taxpaver

If we are determined to have a merchant marineand the proposal that we carry our own enormous foreign trade in our own American-built bottoms is a decidedly attractive one-there is only one possible way in which the thing can be done, and that is by Congress granting an annual subsidy which will cover the difference in cost, including both overhead and operating expenses, of running American and competing ships

#### Protection of Our Foreign Patents

HERE are a good many questions arising out of the war's effect upon patents, patents rights and patent business of one sort or another Most of these have not been adequately discussed, and for most of them there appears to be no immediate disposition in official quarters to prepare an answer Not the most prominent, but by no means the least urgent, of these has to do with the filing of applications in one country by citizens of another

The patent privileges granted by any nation to citisens of another jurisdiction are in every case a matter of reciprocity rather than of legal or moral compulsion If American citizens were barred from taking out German patents, we should not be willing to issue American patents to Germans, equally, if we were to refuse to grant patents to Japanese, we could not reasonably complain at retaliatory exclusion of American inventors from protection in Japan. The freedom with which patent rights are granted by all civilized countries to foreign citizens is purely a matter of international ex-pediency and agreement. There is no obligation resting upon any nation to treat American inventors upon most favored ' basis, if we want American inventor so treated, we can only secure that they shall be by extending like treatment

Today, owing to the war, we have a condition where for months or for years it has been impossible for citizens of certain countries to comply with the ordinary legal conditions laid down for the issue of patents in certain other countries A German could not file at all in most of his enemy countries, most enemy citizens could not file at all in Germany, the dictates of military expediency prevented in many instances the regular course of application and publication from being followed, so that it was not possible to file in one s own country without performing some act that would forfeit the right of subsequent application in some other country, and so on

Foreign countries very generally have recognised these conditions and have passed laws relieving inventors of their burdens. In general, these laws have been in the form of extensions on the ordinary statutory time granted to file and prosecute applications, pay fees and taxes, work the patents, etc But naturally enough, in every case the foreign legislating body, appreciating that international patents are purely a matter of mutual consent, has qualified the concession by adding the condition that it shall only be valid in favor of inventors

whose countries have extended substantially equivalent concessions Thus, England will rehew our inventors of the defaults which would ordinarily have been recorded against them, if we will do so much for hers. But if we tell an Englishman that he can't have an America patent because his Government would not permit him to file his application within the time limit called for by our laws, we cannot expect that Britain will show a great deal of consideration for American inventors who have suffered similarly

Now if we ask what our Government has done to make such concessions available for American inventors. the astonishing answer will be -- practically nothing To be sure Congress did pass an act extending the time for foreign applicante, but it expired by limitation is January, 1918, and has not been renewed American and foreign inventors and patent attorneys of highest standing have repeatedly urged action, but Washington is allent American oitizens have benefitted by the extensions granted in other countries, but purely through Patents on which default could have been claimed have been issued in foreign countries to American citizens, under the special extensions granted in those countries, with the expectation that sooner or later we would meet these extensions in our treatment of foreign applications filed here. If we fail permanently to do this-if we fall very soon to do it, in fact-it seems emmently reasonable to suppose that the conditional clause in the foreign extension acts will be invoked, and the rights of American inventors attacked Should this occur, we can for the life of us see no way out for the foreign courts but to declare invalid the patents issued to Americans under the extensions Probably this would awake our legislators to action-or, would it?

#### A "Bluff" Navy

T is perfectly well understood m the balls of Congress and on Newspaper Row that nobody expects Mr Daniels' second 3-year program to be taken seriously-in other words, this stupendous navy of which we have been hearing lately is a "bluff" intended to be used as a club to drive reluctant of heatant nations into line for disarmament

One of the odd elements (we had almost said come elements) in the situation, is that the Democratic party, who have put forward this preposterous proposal, are by tradition, training, conviction, or any other test that may be applied, thoroughly opposed to any such extravagent outlay of the people's money as this phantom navy would necessitate

In all fairness to Mr Daniels it must be admitted that the responsibility for pushing this billion-dollar navy does not lie exclusively on his own shoulders We have noticed of late that he has stated the President is in sympathy with him, and it must be admitted that what looks like very strong endorsement of Mr Daniels has some in the form of a cablegrain to the House Naval Committee from the President, asking for a unanimous vote in favor of the 3-year program

There can be no mustaking the meaning of this cable-The United States is to invite the nations to gram sarm under the shadow of 35,000-ton battleships and the threat of 16-inch guns Why we should rattle the saber at a peace table, where the other delegates are our own Allies, passeth all human understanding

The American people have been getting news of a sort from Paris, but just how far it agrees with the facts, the censor alone can tell So far as the course of events has been disclosed, we maintain that absolutely nothing has transpired to change the naval situation as we defined it several weeks ago Germany, the one naval power that was a threat to the security of the world, has been eliminated, leaving on the high sees only the fleets of nations that are either our friends or actually our allies. In the midst of this amicable situation, we, the United States, professedly the most peaceful nation on earth, suddenly announce that we are going to set out on a cheme of naval expansion, exceeding anything of kind in the history of the world We are told that this navy will be built, if it ever is, as a rebuke to the nations of Europe, should they not obediently abolish, or greatly the flects which they stready possess sidentally it will cost us one billion dollars a year thus to play schoolmaster to Europe and is not this billion-dollar rebuke, delivered shead of the transgression, somewhat premature?

#### ----

The hierris Benching Figure has proved to be a reasonable mether in cone of its recent tests. In a slight from Dayton to Civveland, Pilot Eric Sprunger and Mechanician Ennest Longshamp drave the plane at an averages speed of 172 miles as hour, covering the 215 miles in 1 hour and 15 munutes. The previous record between the two cities was two hours fast. The Martin bomber corrise two Liberty engines. In the fight in question the machine carried gasoline, tools and baggage weeping 2,500 pounds.

Asvenautical Exposition.—Both Madson Square Garden and the Stray-night Regiment Armory, New Yorkcity, will be required to house the big collection of arphanes to be chibited by the Manufactures Arrent's Association at the Aeronautical Exposition late in February and sarly in March. Sections will be devoted to the Army and Navy machines, as well as to British, French, Jalians and German machines The NG-I, which recently carried 50 passengers, as well as the Caproni and Handley-Page machines, will be shown

A New Altitude Record .- Contrary to the belief seently expressed in this column, the altitude record of Captain R W Schroeder recently made at Dayton, Ohio, did not endure for very long All situtude records were again broken on January 2d last, when Captain Lang, R A F, and Lieutenant Blowers, the former acting as pilot, ascended to 30,500 feet in 66 minutes and 15 seconds A two-seater biplane fitted with a British-designed and British-built engine, was employed in making this new record Due to the breaking of his oxygen supply pipe, Lieutenant Blowers collapsed in the course of the upward flight The pilot in front had ne knowledge of the serious condition of his companion, and kept climbing Having reached 30,500 feet, the come stopped through lack of fuel, and the pilot began a long volplane When 10,000 feet altitude was reached. Lieutenant Blowers regained consciousness men suffered severely from frostbite

Airplane Express .- "The important future of airstated Mr Glenn L Martin in a recent talk with press representatives, "is the wonderful commercial application in making accessible by aircraft rich outlying districts tributary to important industrial and business Disastrous delays, such as have been enconters countered on the railroads, will be obviated, and the speed of delivery by airplane is of course apparent Coast patrol, forest patrol, and mail carrying will be extensively developed British Columbia has established a system of serial forest patrol and the United States is arranging a similar system The success of the mail route between New York and Washington is known to The type of machines adapted and developed for commercial uses will undoubtedly be multiple engined, which will make the possibilities of forced landings remote and will permut travel in all Instruments to enable airmen to meet adverse weather conditions need development, and their production is vital to ensure the successful use of the pirolana to commercial uses

Self-Starter of the Liberty Engine .- The Liberty self-starter is an air motor and compressor in one While acting as a starter it runs as a four-cylinder air motor, cranking the airplane engine through a train of gears, inclused within its transmission. At the end of the transmission is a final drive that connects direct to the crankshaft of the engine This drive runs continually at engine speed and operates a small pump which furnishes pressure for the petrol feed. After starting the engine the Liberty starter automatically disengages and remains so until needed for further use, either as a starter or compressor. In order to keep an adequate air supply in the tank the starter is engaged as a compressor by pushing a button on the control valve while the airplane engine is running at low speed. When engaged the engine must be speeded up to 1,200 to 1,400 revolutions eagme must be specied up to 1,500 to 1,500 revolutions per minute At 230 pounds pressure the compressor automatically disengages. The Liberty starter is light, weighing but 30 pounds It is compact, measuring but sight knobes long. It is efficient, caraling the engine at 180 sevolutions per mirute or more and re-plealshing its own energy in 30 seconds. It is simple, as these are no pipes leading to the airplane engine, so on more are no paper reading to the auritance engine, so that it leaves the airplane engine as it should be. The tank weighs 1214 pounds, making the complete outfit 4214 payers.

#### Science

Proposed Flors of the Philippinss—The Philippins Bureau of Science is planning to start the preparation of a new declocary of plant names of the Philippine Islands and a critical enumeration of all known spocess in the islands, with an adjustment of the sponymy, in preparation for the final undertaking a general flors of the Philippines. It may be possible to combine the Filippino names with the systimatic combine that Filippino names with the systimatic combined sill the technical and local names credited to every plant in the Philippines.

Measurements of Gravity The report of the International Geodetic Association re-entity published states that since the last general report on gravity determinations in the Compter radius dt is Vill conference galaxies the neutral oil of the baseouston has received notice of pendulum observations made at about 300 new stations, for 1870 dwth definite radius have been published. The largest number of those discriminations have been made in the Intel States. The total number of stations in the international system of gravity measurements now amounts to 3,200

Testing of Compasses. The last annual report of the Bureau of standards states that little attention has heretofore been paid to the formulation of spredications and the development of methods of testing compasses. The Bureau has recently taken up the matter in co-peration with the Signal Corp is and has drawn up specifications for sirplane compasses and femalic compasses, besidee constructing apparatus for compasse testing Damping liquids for sarplane compasses have been investigated, leading to the adoption of Keron ne unstead of the alcohol and water inviture formerly in use Studies have also been made on the method of heat treatment and agoing of magnets for compass needles and compensations.

Learning Geography with the Fingers—The American Mixem Journal has published on interesting account of the work carried on for the bland by the American Mixem of Natural History in New Jork especially the arrangements whereby bland children are permitted to handle various byets in the ausuring, including models whish out metricition is given concerning those objects. Whin Admiral Paur gave a lecture at the museum for its blant flat relief maps were provided aboving the Art is laded an Austra areas. The auditors were also allow it to handle a number of mounted Sakindo dogs hitched it is abelge. Among the devices for teaching geography are \$5 \text{ rited} filed by a cache 20 insplies in diameter.

A New Process of Coking — the mastery of why rectain kinds of onel pade dock white others do not has never been fully solved. One of the most unportant industrial problems is that of obtaining, toke from the so-called non-recking? coals and it is therefore highly interesting to learn from the list manual report of Bureau of Standards that a new process for accomplishing this disaderatum has been tested by the Bureau, in conjunction with the Bureau of Mines and the Geological Survey, with results supporting in general the claims of the promoters. The details will be awaited with impattence. The new process in tested at Dover Ohio, by a legal comps of Govinnient experie. The test was the most extensive ever inducted on a coke-even process.

Using Piabes to Combat Majaria | he last ant tal report of the Bureau of Fisheries states that the Bur au cooperated with the Public Health Service in the trik of protecting soldiers from malaria in one of the Lu re southern cantonments. All available means were is d to protect and increase the supply of top minnows (Gambusta) in the adjacent waters and circlul olimirvations were made on the effectiveness of these and other fishes in the extermination of mosquito larvae It has been fully demonstrated, says the report that small fishes are in many cases most effective agents for the control of mosquitoes, but their effectiveness depends upon various conditions, such as the presence of debris and of plants of various species wave action, fluctuations of level, etc , and definite knowledge is lacking concerning the part played by these factors Studies on the relation of fish to mosquito larve have been carried on jointly by the Bureau of Fisheries and the Bureau of Entomology for the past two years

#### Engineering

Reising a 24-inch Water Main - A 24-inch castiron water main was recently raised at Boston to a height of seven feet by means of screw tacks. A piece of land had been purchased for a commercial concern from the City of Boston subject to easement for two water It was desired to till the land well above water level, which would bring the grade 11 leet above the top of the pipes As this would make the pipes maccessible, it was necessary to raise them s ven feet above the previous level Piles were driven at each side of the pipes and wire slings placed around the pipes were carried up to serow jacks supported on caps fastened a ross the piles. The water mains were cut at one end but the lifting was done without unsert wing the toints. As the pipe was lifted the joints adjusted themselves to the new almement

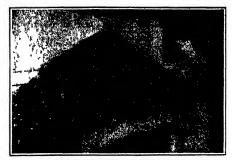

The "Medicinal Taste' of Milwaukee's Water Supply -The City of Milwaukee has been greatly bothered with a peculiar taste in its drinking water This water is obtained from the lake and is chlorinated before distribution. At first it was thought that the chloring produced the taste but a series of tests proved that this was not the source of the contamination seemed to be some connection between the intensity of the taste and the direction of the wind, and finally the source of trouble was located in a couple of plants, one three nules away and the other eight miles away which were producing coal tar products. Quantities of phenol were allowed to escape in the waste and upon test it was shown that this would produce a noticeable taste, even when diluted to one part of phenol in 500 million parts of water The taste was aggravated by the chlorination of the water As yet no method of eliminating the taste has been discovered and efforts are being made to prevent coal distilling plants from throwing their waste into the lake

Creosoting Wood for Buildings -In order to preserve timbers and boards used in industrial building, a system of treating them on the site has been provide In this system pressure is not used to force the creasote into the wood. Open tanks are employed in which a bath of oil is maintained at a temperature between 150 degrees and 200 degrees F 1 he timbers are immersed in oil and and then transferred to a second oil bath in which the temperature is not over 100 degrees I The cooling action of the second bath acts by condensation of the heated air and moisture to assist in causing the atmospheric pressure and capillary attraction to drive the oil into the wood. The periods of immersion in each bath depend upon the thickness and the grain of the wood the time varying from one hour to 15 minutes per inch of thickness A second form of treatment consists in spraying the wood or applying the oil with a brush or The process is particularly valuable in buildings in which a high degree of humidity is maintained roof tunbers of such buildings if untreated are liable to decay in a period of a few years. Freated roof timbers have been found to be in good condition after nine years

Righting a Tilted Intake Crib An interesting bit of engineering work was recently done on an intake crib of the Chicago Water Works In constructing this unb a carson was sunk in the lake and after the casson had been carried down to the proper depth it was found to be slightly out of almement The top was 16 mehes The top was leveled off with concrete and out of level the masonry superstructure was constructed above it It was then found that the cylinder of mesoury was 18 inches out of level and it was necessary to straighten the cylinder The work was done by blasting out a ring of concrete under the masonry and supporting the latter on tacks. Three hundred jacks were used which were operated on one aids to russ the masoury and on the other side to lower it The travel of the tacks varied from zero at the neutral axis to a total of nine inches at right angles to this axis. The work was done under the supervision of an observer who sighted upon 24 targets at 15-degree intervals A corresponding set of targets was marked where they could be observed by the tack foreman and he could check up the figures called by the observer and speed up the macks or slow them down in accordance with instructions. In this way the eyhnder of masonry was rocked back to the vertical

# Reconstruction in Europe—III

The British Plan

By C H Claudy, Foreign Correspondent of the SCIENTIFIC AMERICAN in London

THERE has been much publication at the United Matter of stories bringing forth the wonders of the forchandedness of the Bit tith covernment in considering reconstruction problems long before the necessary for reconstruction problems long before the necessary for reconstruction became appare is. But such storus have usually proceeded from written who took into consider atten the British facts and looked upon them as allhout etch saund as American has kervound.

etted against an American has kground.
Had the I nated States continued in the war for a
period of thrit years there is little dubt that we too
would have had foot a Ministry of Reconsideration as
has the British kingire at least a fairly large and very
best hursaw to some dig statement working on the probbest hursaw to some dig statement working on the probmoney of the statement of the content of National
Defons. one eraed only with What shall we do after
the war?

As a matter of fact. Britain with her wholly different and mitch more complicated problem, while she un doubtedly gave, man believed to throm the beginning doubtedly gave, man believed to throm the beginning of the state of th

If it dis some credit must certainly be given the

machinery It is of course impossible to draw its details in a page—scarcely in a book. But its more important shafts flywheels, springs and levers can be indicated.

indicated
The Ministry of Reconstruction is wholly an advisory department of the government with no executive powers—nuch like our own Council of National Defense in that respect. The or creating it define its powers as may arise out of the present war and to institute, and conduct such inquiries prepare such schemes and make with recommendations as the Minister of Reconstruction shall think fit. In addition the Minister of Reconstruction may be given authority to not with any govern

smart mint of the acciton the sommer or reconstruction may be given authority to not with any government authority by order in council of his Majesty to be one of the most vial engines in the British governmental machinery. In getting it in shape to function it has been divided into branches which deal with conmerce and production including the supply of materials, with hinance shuping and public service with labor and industrial organisation with rural development with the machinity of both central and local government including health and education and with housing and internal transport.

The Ministry as a whole and every branch of it is as arranged as immediately to be notified of any proposal looking to the solution of any post-war problem which may be originated in any department of the givernment. If any responsible person or organisation anywhere in the nation has a scheme or an idea regarding any feature of reconstruction the Ministry or some particular branch of it is where he or they go. The Ministry as a whole or

any branch of it may initiate any scheme or idea of reconstruction and if the Minuster thinks well of it, investigate it and make a report upon it. The Minustery in, in effect first a great clearing house of ideas—in a nation as devoted to the purpose of reconstruction in the full meaning of the word is well as to its lesses definitions of restablishment and readjustment, that is prachage its

most important function.
Considering all/reconstruction ideas wherever originating with relation to each other and with special reference to the branch of government which has security power in the particular premises the Ministry builds its reconstruction policy, for submission to the Cabinet and if there approved, to Parliament for any accessary ligations.

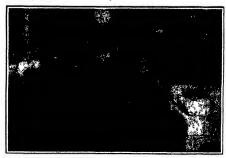

lative actions which may be required.

Obviously this sort of a program is no more a one-man job than a government is a one man job. So the Minuster has created an Advisory Council working in sections four in number devoted to production and commercial organization to finance transport and public services, companies to the services, and the services of the service

It is in this council that the true democracy of the reconstruction program has its origin for each section has representatives of all the principal interests rating with a Thur in the section devoted to finance are not only financers but into runerest—in the section which deals with agriculture are not only agnatultural interests to the tomost interests represented so that no problem as connidered merely from its main but from all its seconomic angine.

Battery of indenting machines for 303 cartridge cases under the watchful eyes
of their women operatives

When the seven million soldiers return to peaceful pursuits, it is proposed to have all the clothing factories running on a peace basis

The work of the council is sharply differentiated from that of the Ministry as a whole The former deals with the specific instance only, the latter with the whole subject The council is well into its labors on many of these specially referred toples, among which are such very diverse, but very important matters as the standardization of rail-way equipment, post—war rationing of industry, organisation of rural information

Metric suppossible here to go unto all the problems which are being considered or which have been considered by the Minustry Some of them will have a very far reaching effect, not only upon the United Kingdom, but upon the United Kingdom, but upon the United Kingdom, but upon the United Ritates Of some of these, at least, it is hoped to treat at greater length later For the present, however, many of these activities must be constituted from one must be constituted from one some the constitution of the

In the branch dealing with is a national probler commerce and production, for instance, the supply and control of raw materials for

for instance, the supply and control of raw maternals for post-war industry is a very vital matter. So us the subpost of financial facility for British commerce and indusry Many industries in English as the missing of financial facility for British commerce and industry Many industries in English as the matter of the provision in a directly interested and is considered by the Ministry of Meconstruction in connection with that department Similarly is the matter of the stablishment of new industries a matter of great moment, and here America may find herealf more than an interested spectator, for the committee appointed to consider this has already made a report showing what new industries can be and what should be established and many of them, especially what should be established and many of them, especially as England, but which we know that consider the has already messes in the United States, affect American expert probabilities in no small degree. Volume of demand of British goods, the nature of that demand, and how best to create a larger amount is getting serious attention, and, to help fill the domand, investigations into improvements in trade organisations to a better and more enonomical production, distribution and marketing, are connomical production, distribution and marketing, are

## The Principles of Camouflage—III

#### The Visibility of Airplanes By M. Luckiesh

N the Great War the airplane made its debut in I warfare and in a short time made a wonderful record still when hostilities et med aerial camoullage had not here put on a scientific basis. No nation had developed this general aspect of camouflage systematically or to an extent comparable with the developments on land and an extrat comparation white he developments on long sin-ers. The chief reason was that somutific data which were applied by the reason of the beautific data which quarters there applied to be inwarrent I prejudice, against striving for low visibility of aircraft. But before the close of the war the write completed an extensive investigation of the fundament ils upon which the attainm at of low visitality fr airplane must be based beliations of the publicas encountered in rendering air-planes of low visibility results I and various recommendations were made. The experiences and data will be drawn upon only in a general way but it is hoped that details and interesting byproducts of the investigation can be presented at a lat r date. In this general review such details would consume too much space for the intention has been to present a broad and concise view of the subject of camouflage

The visibility of airplants presents some of the most interesting problems to be found in the development of the sea of the basis for camouflage and many novel and thrilling experiences attended the accumulation of the tarining experience actuated the set diministron of the requisite data. The gueral problem may be subdivided according to the type of airplane its field of operation and its activity for example partel eraft which fly low over our own lines would primarily be cannouflaged for low visibility as vived by senomes above. High flying craft would be rendered of low visibility as viewed primarily by the enemy below Airplant's for night use present other problems and the visibility of seaplanes is a distinct problem owing to the fact that the important hackground is the water because scaplanes are not ordinarily high flying craft in all these considerations it will be noted that the activity of the sirplane is of primary importance because activity of the sipinals is of princed its in rendering the craft of low visibility. This aspect is too complicated to discuss thoroughly in this article.

#### Viewing Aircraft from Above

The same fundamentals of light color and vision apply The same fundamentals of light color and vanon apply in this field as in other fields of samulage but different data are riquird. When viewing aircraft from above, the carth is the background of most importance. Cumulus slouds on sunny days are generally at allitudes of 4,000 to 6,000 feet. Chould are not always present and besids they are of each as with rent order of brightness from that of the earth that it by vanious be considered in camouflage designed for low visibility from above. In other words the compromise in this case is to accept the earth as a background and to work on this basis. We are confronted with scasonal changes of landscape but inasmuch as the summer landscape is of greatest impor-tance generally it must be the dominating factor in dering low visibility from above

On looking down upon the earth one is impressed with the definite types of areas such as cultivated fields, woods barren land and water Different landscapes woons parren land and water Linerant landsrapses contain these areas in various proportions which fact must be considered. Many thousand determinations of reflection factor and approximate color were made for these types of areas and upon the mean values camouflage for low visibility as viewed from above was de-

Wooded areas are the darkest general areas in a landscape and possess a very low reflection factor From above one sees the deep shadows interspersed among the liighlights. These shadows and the trapping of light are largely responsible for the low brightness of on ingine are largerly responsible. This is best illustrated by means of black velvet. If a piece of cardboard is dyed with the same black diet is will diffusely reflect 2 or 3 per cent of the mendent light but the black velvet will reflect no more than 0.5 per cent. The velvet fibers provide many light traps and east many shadows which reduce the relative brightness or reflection factor far below that of the flat cardboard. Cultivated fields on which there are growing crops are nearly twice as bright as wooded are growing crops are nearly (wice as bright as wooded areas, depending of cursu youn the donaceness of the vegetation. Barren sunisked lands are generally the brightest large areas in a landscape, the brightness depending upon the character of the soil, wet soil as darker than dry soil, owing to the fact that the pores are filled with water thus reducing the reflection factor of the small particles of soil. A fix blotting paper which reflects 75 per cent of the incident light will reflect only

bout 55 per cent when wet Inland waters which contain much suspended matt are about as bright as grasing land and ou Shallow water partakes somewhat of the color and brightness of the bad and deep ocean water is about as brightness of the bed and deep ocean water is about as dark as wooded areas. Quiet stagnant pools or small lakes are sometimes erosedizely dark owing to the fast that their brightness as where vertically a simost entirely due to surface reflection. If it is due entirely to reflection at the surface, the brightness will be about 2 per cent of the brightness of the senth sky. That is, when we were sufficient to the brightness of the senth sky. That is, when we were sufficient to be about 2 per cent of the brightness of the senth sky that is a surface of the senth sky that established by actual measurements

#### Earth Patterns

The camouflage which has been applied to airplanes for the purpose of obtaining low visibility as viewed from above has not been founded upon systematic experiments as can be seen by the patterns used. The earth patterns were extensively studied in this investigation and concrete solutions have been recommended. Although it is out of the question to present a detailed discussion of this important phase at this time attention will be called to the manner in which the earth patterns diminish with increasing altitude

For simplicity assume a camera lens to have a focal length, equal to 10 inches, then the length rof the image

HOSTILITIES came to a close before the art of camouflate had been extended to the protection of aircraft, but studies of the problem had been made and these are outlined in the present article by Mr Luckiesh This is the last instalment of the series The first, appearing in the Scientific AMERICAN of January 25, 1919, dealt with the art of concealment and deception as practised on land. and the second, in our issue of February 8, with low sissbility and optical illusion on the sea -EDITOR.

of an object 100 feet long will be related to the altitude h in this manner

$$\frac{x}{10} = \frac{100}{h}$$
, or  $x h = 1000$ 

It is seen that this is the equation of a hyperbola By substituting the values of altitude A in the equation the values of the length z of the image are found. It is easier for some to visualize this relation by means of a change in size of the image with altitude

| Altıtude, h | Size of image, z |
|-------------|------------------|
| 1.000 feet  | 1 00 mehes       |
| 2.000 feet  | 50 mehes         |
| 3 000 feet  | 33 inches        |
| 4.000 feet  | 25 inches 2      |
| 10,000 feet | 10 inches        |
| 20,000 feet | 05 inches        |

It is seen that the image diminishes less rapidly in size It is seen that the image diminutes less rapidly in size at the altitude increases. For example going from 1,000 feet to 2,000 feet the image is reduced to one half. The 20,000 feet the image is reduced to one half. The 20,000 feet by taking a service of photographs and knowing the reduction factor of the less it is a simple matter to study pattern. An amphane of known dimensions can be placed in the imagination at any altitude on a photograph taken as a known situated and the fullify of certain patterns is at once evident

#### Earth Haze and Cloud Haze

It is out of the question to present colored illustrations in this article and values expressed in numbers are meaningless to most parsons so a few general remarks will be made in closing the discussion of low visibility will be made in cioung the discussion of low visibility as viewed from above. A black craft is of much lower visibility than a white one White should never be used. The paints should be very dark shades. The hues are approximately the same for the earth areas as seen from the earth's surface. Inland waters are a dury blue-green or bluish green, and deep ocean water is a

geenish blue when viewed vertisally or neastly se. Before considering other aspects of camouffage it is well to consider some other factures such as has, circulas and sky. There appear to be two kinds of hase which the writer has arbitrarily called sorth hase and diptud hase, respectively. The former consists chiefly of such and dirt and sorois and untually extends to an altitude of about one mile although occasionally it extends much higher. Its upper limit is very distinct as seen by the higher. He supper limit is very distinct as seen oy use "false between This horizon is used more when flying high than the true horizon. Out of the top of this hase cumulus clouds are commonly seen to be poking out like nearly submerged tockers. The "cloud" hase appears somewhat whiter in color and appears to extend some-

nearly submerged sobergr The "doud" hase appears one services where the color and appears to strend sometimes to allutudes of several or even many miles. The services of the color of the

#### Airplance Viewed from B.

Doubtless it has been commonly noted that airplanes are generally very dark objects as viewed from below against the sky Even when painted white they are much darker than the sky As they ascend the sky above them becomes darker although to the observer on the ground the sky remains constant in brightness. However, in ascending the sirplane is leaving below it more and more luminous have which acts as a veil in ading to sersen it, until when it reaches a high slutude the combination of dark sky behind it and luminous hase between it and the observer on the ground renders it or low vanishity Another factor which contributes somewhat is the diminishing size as viewed from a fixed position at the earth. The minimum perceptible contrast becomes larger as the size of the contrasting patch di-

minushes
Insemuch as there is not enough light reflected up-Inasmuch as there is not enough ight reflected up-ward from the earth to illuminate the lower ends of an opaque surface sufficiently to make its brightness com-parable with the brightness of the sky it is necessary, in order to attain low visubility for airplanes as viewed from below, to supply some additional illumination Com-putations have shown that artificial lighting is imprestroable, but measurements on airplane fabrics indicate icable, but messurements on arplane fabrics indicate has on easy, days a sufficient brightness can be obtained from direct smilight diffused by the fabric to increase the brightness of the day. On overcast days an arplane will indicate the days of the day. On overcast days an arplane will dissipply sliminated. That so, the brightness of the sky. However, low validity and not obtained on sunny days which is an advantage over high validity at all times as a the case with sipfaness ow in use Many observations and computations of these and other factors have been made so that it is possible to compute advantages, but also disafrantages.

Having considered low visibility of already as viewed and workers. Having considered low visibility or already as viewed and workers. Having considered low visibility of already as viewed.

advantages, but also disadvantages.

Having considered low visibility of aircoaft as viswed from above and from below, respectively, it is of interest to discoust brefit the possibility of attaining these with a given airplaine. Frankly it is not practicable to do this an airplaine to be of low visibility against the earth background must be painted or dynd very dark shades of appropraise color and pattern. This readers it almost opaque and it will be a very dark object when viswed against the sky. If the lower surfaces of the sirplane bell oversides a fact object against the sky and a very dark object against the sky and a very dark object against an overseas sky, except at high a situation of the sirplane still residuals as dark object against the sky and a very dark object against the sky are as a already explained. The only practicable method of (Constants or page 44):

#### The German Art of Make Believe

#### How Germany Got Along With Various Substitutes During Her Prolonged Isolation

PRIOR to the war by far the greater portion of raw attiffs required by Germany were imported from abroad (in reund figures valued at about 10,000,000,000 marks) The blookade practically shut down foreign imports It is thus natural that the question of sub-stitute materials became the absorbing one in Germany Officeal, indistrial, and scientific Germany applied its utmost energy in attempting to solve it. The question was not only to take care of the pressing war requirements but also the difficulties that might arise if the country had

out also the dimentices that might arise it the country had to become permanently commercily independent. The principal efforts were made in the fiber and thread industry. The most interesting inventions in the field of textile substitutes are those procured from burning metéles, and it is believed that a most valuable suband it is believed that a most valuation suc-stitute for cotton has been found A company was founded to investigate and encourage the use and produc-tion of nettile fiber As the demand and production in-creased, this company was soon obliged to absorb the

earlier and smaller concern devoted to the work Instand of the former process of steeping, an engineer invanted a new channes process for the extraction of the giutinous matter of the plant fibre, which, according to the opinion of experts, as of the highest value. In the cultivation of burring netting rose tropgress has lickwise been made. The present company is planting great quantities of nettles on previously untilled issued, expe-entally low lands, and forming regular plantations. Thus the basin of the former Taitower Hea is now being planted with nettless and seconding to the most favorable methods with nettless and seconding to the most favorable methods and Notices are historical and the very native. earlier and smaller concern devoted to this work Nettles are likewise being planted as if they were in their wild or natural state, and in the shade as well as in the sun, experiment having shown that the plants thrived in

They are further being planted in alder woods and in regular farm fields, the latter having previously been believed secutifically impossible. Thousands of serve have been cultivated in the Friesack, Stottin, and Celle districts. The nettle needs but httle care and fertitizing,

but water at least 18 meters (about 50 fect) below the surface. Specialists place particular importance upon the fact that their cultivation really improves the soil. The nettles are also percunnis and the same field can be cultivated with them for five years running.

Spinning of nettle fibr has been known for years.

The old Egyptians were familiar with it and the Garmans have long known it. In modern times however it did nave long known. In mouren times however it did not seem practical, owing to the difficulty encountered in separating the fiber from the stems. The chemical separation of the fiber from the stems. The chemical separation of the fiber from the stems and the whole thing both possible and important to large scale produc-

While nettle fiber has proved a valuable substitute for While nettle moer mas proved a valuatie sunstant; for cotton, so has the stem of rushes (Typha) proved to contain valuable substitutes for himp and jute. Up to now no practical use has been found for typha—it has merely been considered a uscless wild growing pond merely been contained by the Cerman press typhs has now been found to be of the greatest white and service and the contained by the contained to the present

Peat fiber belongs to the most interesting discoveries in the field of substitute textile raw stuffs. This immot in the field of substitute texture the stiffs in its innor, however be preciseally used with at maxture with other kinds of fiber. A mixture of 40 per cent peat fiber and 50 per cent wood gives at or ling to the opinion of German experts, a very storing and dumble material that looks extremely well and is excilent for means dotting looks extremely well and is veiled if it must stolling in the valuable qualities of p it is his r he were are insisted by the difficulties in proturing the pat. Only the younger moss turf called frantial criminus some eight per cent of the curls whith an its employed manying moss black peat (and for luming) can not be employed. The production from about 5,000,000. double hundredweight of peat amounts to about 100,000 double hundredweight of fiber in other words, a very small amount when the later and the actual yield ar both taken into account

The textile industry has also done its best in order to find a substitute for the leather which is required in constantly increasing degree. A German textile com-pany has succeeded in finding a prifect substitute for appears which will also a times of poace prove most

Not only in the textile industry but also in other fields German ingenuity has been liusily occupied in its at-tempt to find substitutes. Special interest was thus directed toward the production of artificial rubber, s question which has been technically solved in times of peace Artificial rubbir was produced prior to the war, but was shortly given up owing to the fact that cultivated rubber fell in price from 30 to four marks per kilo (2 2 tounds) When the scarcity of rubber again arose with the war, the production of synthetic rubber was again considered Substitutes however had to be discovered owing to the lack of raw stuffs accton and aluminum When it was found possible to produce aceton from roal and carbide and to produce aluminum on a large scale, the production of artificial rubber could be undertaken But the synthetic rubber is evidently merely fitted to a war need, for it can not compete with the genuine article Added to this its cost is much higher than London quotations for genum rubber

I ndless energy was also expended in the field of food stuffs. The question of employing lupine as a foodstuff on a large scale was studied. A large company with a capital of 3,000,000 marks was founded for this purpose m Chemnits

The food values contained in lupine, however, o prove serviceable when the bitter mid, which makes the lupme fruit entirely unpalatable, has been removed The flour which is produced tastes good, is very nutritious (Continued on page 182)

#### A Better Guide for the Blind Pedestrian

476 kifth Avenue New York

To the Editor of the SCIENTIFIC ANIRH AN
I have in mind a device which I believe to be new for
the aid of the blind in walking.

My idea is to place on the end of a light walking stick a small whoel say two inches in denietr with solid rubber tire. The wheel is to be proved so as to turn in any direction, like the roller on a talk kg. This came would be six or eight mehos longer than the ordinary came, so that the wheel would run a few feet alread of

came, so that the wheel would run a fix feet alread of the man and each sat feeler approximation for each but p, step or unevenness in time, to allow for it. I believe one would become see justiced in the use of that that he would earned by least in stipping of an ordinary surp. If anyone will try to wall blandfolded, over a short proof of wilk in which there are a few small over a short proof of wilk in which there are a few small as wheelbarrow, he will, I thank find a great difference Of course that is crude, but in the absence of such a device it is perhaps the best and, to approach the subject device it is perhaps the best way to approach the subject

It may be that a metal tire would give better results than a rubber one. The cane should by all means be adjustable in length so as to suit the user The wheel and all metal parts should be light and strong, probably

and an motal parts drough he light and strong, probably of aluminum

I have no thought of taking a patent on this, but simply believe it will benefit those blinded in the war, and select your columns as the best medium of publicity for such a Buggestion

PVT ALEXANDER McMILLIN Co C, 11th Machine Gun Pattalion

#### Wireless Control in a New Dress

To the Lditor of the SCIENTIFIC AMERICAN Your editors in a recent issue on the subject of radio monopoly covered the ground thoroughly, and I am sure was greatly appreciated by the large number of your readers who are interested in radio. That per-necuous bull was defacted and for a turn, all seemed well for the free development of the art

On the 23d inst, however I noted an Associated Press dispatch in the Washington Stir to the effect that an 'Interallied Communications Conference' was to meet in l'ans on January 25th and among other subjects was to arrange for the control of radio after the war lu consideration of the idea of control expressed by

our naval authorities at the recent hearings before the Committee on Merchant Marine and Fisheries, one cannot help but wonder if there is not some plan on foot to obtain by means of an international agreement the monopoly that was denial by Congress

I respectfully submit that our internal afferra such a operation of small radio stations should not be governed by laws made abroad in this manner

Would it be too much to ask of the SCIPATIFIC AMERICAN to look into this matter, and again sound the

IOUN & Princers

#### Farming Implements

To the I ditor of the SCIENTIFIC AMERICAN In these times when so much inventive and manu facturing enterprise is given to plowing maclouds and tractors. I have been surprised that some one does not go one step farther back and nevert a digging machine to be operated by the weight of the engine, as a man uses his weight to operate a spad or digging fork. Such a machine for small holdings would have immense advantages over any kind of plow or tractor and could vantages over any kind of pious or tractor and course work areas even as small as non sere to any depth required and the weight of the engine would be an advantage and their would be no tendency to ship past the work to be done. Digging was the earliest and best the work to be done Digging was the carliest and best method of cultivation and plowing is only a poor substitute, invented to save manual labor. Why should we not go back to the best system now that we possess that power that is adaptable? Bullocks and horses the first tractors of course, could not dig, hence the invention

of plows

Murrulen Wingen N & W

## The World's Coal Supply

Where It Comes From and How It Is Used

THE fundamental basis of civilization is fuel and the I one universal fucl is sal. We burn wood and oil and gas when we can or when we have to but we always recognize that these finds are more or less substitutes for the standard fuel the fuel upon which the industrial fabric really depends coal Accordingly figures bearing upon the supply and production and consumption of coal are always in order and always interesting I rom a variety of sources to numerous to estably there have recently come to our attention a quantity. I statistics of this sort and we present their herewith in painless form for public consumption

form for public consumption.

In the first place, we are tild that of all grades of coal ranking with or ab \( \) bitumin as the visible supply is \( \) at \( \) bitumin as the visible supply is \( \) that in the knows and \( \) (000 feet in depth—extraines which in the knows and \( \) (000 feet in depth—extraines which under present methods are not usually within the possibilities of commercial use but which will doubtless be made available by the time they are needed. This

figure is imposing a nough but it does not transcen i the human imagination by quite so much as it would have four years ago when we were still counting in militaus rather than in the bil Loans have since made us accustomed. Indeed, from billions to trillions constitutes a leap exactly as long as the one which in passing from millions to billions In addition to this

vast hoard of combusts bles which Nature has laid away for us there may he some three tril lion tons of sub-bitugrades which does not, for the present, get in-ventoried with the other and which we may accordingly ignore heresome parts of the world do very nicely with coal that is mostly lignite, and that everybody may and that everybody may have to come to it some day. Of the 4 ½ trillion tons that qualifies as regular coal the United states is credited with nearly half - two trillion comes China, with a trillion tons German with 400 billions Canada with 250 bil lions Great Britain with 200 billions Russia and Austria with 50 billions each The countries cach The countries comprising the rest of the world are individ-ually nowhere though them they

muster the very pretty total of 550 billion tons should descend to counting cost in incre millions of tons we should find France and Belgium leading the pack of

CAPACITY UP TO INCOME PROPERTY OF

CONLINE OVER ME GOO ALL OWATES

Annual production naturally does not in every case follow the resources in a gantule. Of course the United States leads here again with 513 million lons for 1913— States page art significant of the past four twelvemouth born and is still hearing far more than its fair share of the bust full presents of the bust four twelvemouths born and is still hearing far more than its fair share of the burth of statistical service. But China and Canada standing well up in resources have developed these resources to such a small extent that the former is included under the general licating. Asia which is credited with 47 million tons, while our northern neighbor suffers the even greater indignity of being lumped with "All Other ( quatrics ) in the production of 57 million tons Germany and Great Britain, ranking fourth and fifth in the count of resources, are practically taid for second place in production, with 275 and 290

milion tons respectively. Then come the former Dual Monarcht, with 54 milion tons and Russus with 32 milion tons while France and Belgnum, not specifically mentioned under the head of resources here enter to the amount of 40 and 22 million tons, in order Of course, it is a reckless assumption that production in this ratio will continue anofamicly. The very fact that some nations will approach before others the extension of the continue on the contribution of the fuel needs of the world, today consists in showing how long their several deposits would last, at the current rate of deploting the openist would last, at the current rate of deposits of the contribution of the fuel needs of the world, today consists in showing how long their several deposits would last, at the current rate of deploting the contribution of the contribution of the fuel needs of the world, today consists mishowing how long their several deposits would last, at the current rate of deploting the contribution of the contribution of the fuel needs of the world, today consists in showing how long their several deposits would last, at the current rate of deploting the contribution of the contribution of the fuel needs of the world. posits would last, at the current rate of depletion

posits would last, at the current rate of depistion Making the calculation we find that the United States is using put coal at a rate of which would lead to exhaustion in 4,000 years (rend Britain in 550 years Germany in 1,500 years Russian in 1900 years, Austria-Hungary in 1,000 years Belgium in 350 years

but merely to her financial inability to burn it at the price which she would have to pay for getting it from any cristing center of mining operations. Taking these and all related factors into consideration, one authority has suggested that the world's coal may reasonably, be expected to hold out, under present methods of distribution and use for shout 1 500 years

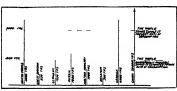

tion and use, for about 1,500 years Some idea of just what these methods are may be got by glancing at a series of figures that have been compiled showing what was done with a normal year's production of coal in the United States and in Germany The comparison is not a stretly accurate one, since in the United States as good deal of coal that is actually earnemed in the heating of dwelling planes gets charged to the production of power Under all other bands the compilations appear to follow closely the same lines in the two countries, however, and may be taken as a reasonably lar presentation of the manner in which the use of coal varies between nations on the two sides of the big pond

It is not necessary to in-corporate the figures into our text, since they are to be found at the proper points in the diagrams herewith It will be herowith It will be noted that we have made the comparison a fair one by ignoring actual tonnages and confining ourselves to the percentages of the national production used for coal production used for each purpose Any one who will, can convert them into actual tonnage by using the total production figures already

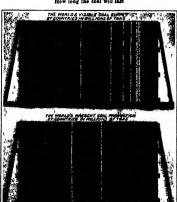

On the whole, the On the whole, the divergences between American and German practice are not extraordinary. The sum total of coal consumed for power production, before and after coking, is reasonably close in the two cases, though Germany makes a far better showing with regard to the amount coked before using. This, of course. using This, of course, gives her a real superiority, since the elements driven off in the coking, and recovered when that is carried on under modern methods, are of

modern methods, are of value and represent clear profit Perhaps her ad-vantage in the figures here may be taken as fair measure of the de-gree to which Germany has besten us in the in-stallation of by-product coke ovens to replace the old and wasteful bee-huge time. hive type Domestic use shows remarkable correspond-ence in the two coun-This must not be taken too seriously, h

in view of the inaccuracy of this item in the American figures Certainly the impression prevails that we use

figure . Certainly the impression provals that we use a lot more onli in heating our house hother and longer than seems necessary to the European It is to be expected that of the onal produced and used in a compact area like Germany, less will be required for realized due than as the case in a large territorial until like the United States . For example, if all the coal mined in the like the country left to its own resources for fuel, no cost would have to be used up in carrying Pennsylvania was 18 tone per capita each year, while California, with the water power and it at oll fields and its great distances from coal deposits, gets along with but 18 ton. Never-compact of the control of the country left to the sure. Pennsylvania court of the compact of the country left to the sure presents and the control of the country left to the sure. Pennsylvania uses 18 tone per capita each year, while California, with the water power and it at oll fields and its great distances from coal deposits, gets along with but 18 ton. Never-country and the country left to 

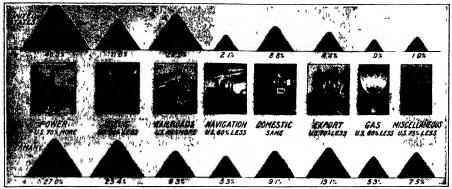

How long the coal will last

How the rate of coal consumption drops as the size of the power plant increases; and the division among the countries of the world's visible supply and annual production of coal

while if we assume that the total production in the groups containing China and Canada, respectively, is practically all attributable to these centers, we can estimate that the Canadian fields would hold out for 4,000 years and the Canadian fields would hold out for 4,000 years and the Chinese for five times as long. For the world as a unit the figure is 3,400 years but this of course would be greatly reduced if the imperfectly explored Chinese fields should turn out to be a disappointment, either in accessibility or in workshiftsy or in quality

As a matter of fact, however a moment's reflection will make obvious that the world has not a coal supply will make obvious that the world has not a coal supply for the next 3,400 years in supil. In the first place, we may reasonably look forward to a fairly constant in-crease in population, with consequent increase in con-sumption. And in the second place, it seems certain that as the Chinese fields two opened, the docamade of China, now almost negligible, will be greatly expanded. The case can hardly be otherwise, for China's small soal consumption is due to no unwillingness to burn this fusi,

su in the center e ma ere I tw If he we coke \*0 per cent less of our nat than the many does of horse t pper and lower facures represent per cotages of annual produ How Germany and the United States compare in the uses to which they put their coal

railroads is coal I von so, the discrepancy between our showing and Germany s is considerably lessened when we recognise the great role which internal navigation plays in the continental system of distribution and lump the items of coal for railroads and coal for navigation Internal navigation is the factor of importance here because the vessel that coals in Germany for a voyage here evens the matter up by coaling here for the return

interesting, even though of no practical conseque are the calculations of a British contemporary who has looked into the question of the air necessary to burn up the coal that we use in a year. The accepted standard is 15 pounds of air for the combustion of one pound of coal On this basis, and taking the world's consumption of coal to be 1,400 million tons per annum the total amount of air needed in the combustion of this tonnage would be 21 billion tons, or 617 million million cubic feet This amount of air would fill a cube of 16 miles or a aphere of 20 miles diameter Roughly it represents one 240,000th part of the weight of our atmosphere of it after we have no more coal to burn When we talk about ultimate exhaustion of our coal

When we talk about ultimate exhaustion of our coal we pare the way for discussion of means toward conservation. When we consider that the cheap coal always gets taken out first leaving the innecessible venus for a later generation we must realise that coal will never get cheaper than it is, and will in all human probability continue to get more costly. Here is another and, it must be confidenced a far more immediate sput to continue. in the use of coal What are we going to do about it?

One thing that we are going to do about it sooner or

later, is to burn the coal in great central stations at or near the mines In other words, instead of transporting near the mines — in other words, instead of transporting the fuel to the user, we shall transport the power over long-distance transmission lines — Development of such lines and of the central power station itself are sufficient problems to absolve our engineers of any charge of neglect in that they have failed sooner to bring these conceptions into effect. When they do come into effect, however, it will be found that elimination of the burning of coal to transport coal is by no means the only saring produced Canadian Government engineers, after a most paintaking survey of the field, have estimated the rate of consumption of coal in electric generating stations of various size, using coal-fired boilers. In a station of

ered solvers. In a station of capacity under 1,000 kilo-watts, the very best that can be hoped for is the generation of one horse-nower ner vacbe hoped for is the generation of one horse-power per year for each 26 i tons of ond bursed. In stations running from 1,000 to 5,000 kilowatte capestry, the coal consumption should average it tons per horse-power per year. When the squarty is increased than the renge 5,000-1,000 the benefits is small, its coal that was per horse-power per year is selection; and the coal that th capacity falls between 10 000 and 50 000 kilowatts however the coal consumption fails to 9 32 times for stations of capacity 50,000-100 000 kilowatts it is 6 57 tons while in stations whose capacity exceeds 100 000 kilowatts, it has been found possible to furnish one horse-power for one year by burning only 6.25 tons of

coal It must be remembered that the very advantageous hure has to do with plants in who is ill outditions are favorable in particular where the pash load is very moderate and where the minimum 21 hur 52 week demand for juece as substantial on. N. plant can create a record for low cost unit wif runs substantially all the time at an approximat on It fill cupretty. But when it does so run, results are little short of amazing to the plants studied by these novelta, after him with the plants studied by these novelta, after harm 21 tons of coal per annual horse-power in stating generating current for sale, and 23 tons is industrial power plants serving single factories.

#### Passing a 50-foot Ship Through a 44-foot Canal

THE floating of lake steamers through the Wellani Canal by outting them in two so that the locks will accommodate them, and then requiring the halves for ocean use is by now an old story but it has recently cropped up again with a hrand new angle. The latest ship to be floated through the canal in halves was not smp to be neared varying the range in active was in-merely too long to be accommodate in the beks hit it was too wide to go through the canal at all yet it made the trip successfully The snewer to this seeming paradox as shown in our

The answer to this seaming paradox as shown in our correct of this vecic, was the tiles of 1 A lusts of the United States Shaping Board Lake the answers to enany knotty problems it was simple cough once Mr Eustis had pointed out how it was to be done. The shap, a 10,000-ton freighter of 460 feet length and 50 feet beam, was bisected in the ordinary fashion then such half was gently but none the less firmly rolled over on its beam ends to be towed through the Canal which has a width of 44 feet only Leven so it was a tight squeeze—so tight that the engineers in charge did not eligible to the control of the control o

side with a clearance of cight niches on each side between her decks or the keel and the side of the big ditch

As may be imagined the task of rolling a 10 000-ton vess I on her add is no early one. No attempt was made to do it by means of cranes or any such direct incohanical means. A series of big tasks was secured to what was means A wree of big tanks was secured to what was intended to become the unite raile of each hall of the ship and these were pumped full of water. The calcu-lations were will made and the capacity of the tanks proved just sufficient to capacia the sections which rolled gently over on their sides just five hours after the pumps were started. After the passage the sections were rolled back by attaching similar tanks to appro-priate points along the expise liked

One interesting feature is found in the fact that none of the machinery or heavier fittings were removed for the rolling and floating Accordingly the refitting of Van Hase for service after she got through the canal will be a simple matter. We say will be because while the passage of the Canal was made late in the fall, it was not plauned to bring the two sections to their destination and fit them together until the coming of spring One section of a freighter had already been lost in Lake Ontario last year and the engineers were in clined to await a season when they would be taking no chances with the weather It may be said that the joinings of ship sections brought through the Welland passage is effected at Montreal whence the restored passage is elected at monthless whence the research wessel proceeds under hir own power so the necessity for taking into account the critchets of the weather man in towing sections through Lake Ontario is apparent

#### Chloroform Application by Tube

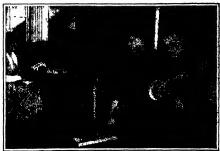

A NEW method of administering chloroform has been brought out in France by Dr Guiser He no longer applies it by the usual compress or mash placed over the mouth, but introduces the chloroform vapor directly mouth, but introduces the chlorotorm vapor unready into the lungs through a tube running into the windpipe. The tube mothod has already been employed in several lundred cases and with great success. Besides being hundred cases and with great success. Besides being very useful for operations to be performed on the head and neck, it is of great interest because it never produces the names which is almost always the result of ap-plications of chloroform in the ordinary fashion and phoances or entertorm in the ordinary lashion and thus the patient is releved of cause of suffering.

The effects of the new method will serve to explain the reason why chloroform applica-

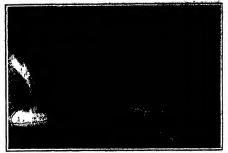

tions always produced nat when operating by the for-mer method for it appears evident that the name caused by a part of the chlorocaused by a part of the chloro-form vapors being absorbed by the esophagus and the stomach Of course this is not necessary, for the whole of the vapors should go to the lungs, and this result is now reached by the new method It therefore marks quite a progress in the right

### **Human Reconstruction**

#### How the War's Shattered Victims Are Reeducated for Civilian Life

NOT the least important part of any reconstruction Note that important part of any reconstruction program is the rest ring of the manned and crippled soldiers to a failure site, is failure site, of industrial usefulness. The European beligerents have long been faced with that problem and ever sin of the manned and eriplied first began to flow back from the harthefedden. of the war those countries have maintained hospitals of the tare and schools for their resduration. And now the United States is brought face to face with the same problem which it has tackled with the same acu men as the other problems of modern warfare

The first duty of a nation toward its maime crippled solds raise to restore them to as near their former physical condition and usefulness as possible. Thus the soldser pats at its cared for until his strugth is regained. If he has lost a limb an artificial one is provided after careful study and fitting to make certain that it comes as near replacing the lost limb as is mechanically Then the patient is resolvented first in the us of the limb and then in h w to use it in a more or less prolonged course of occupational therapy. In instances where woulds have cause I stiffness or loss of dexterity a treatment is given followed by a course of exerc tending to restore much of the original agility and dexterity of the muscl s and bon s

How tiffened muscles an l bones are again restored to their customary or near customary state may learned from the accompanying illustrations which depict several in handal devices which are typical of this imply throughout this country. In this case the devices are in use at the Chine for Functional Reedication of Disabled S ldiers and Sulois and many

of the patents are our cripped dier ne of Chite su Thierry fame with the Marines well represented The men are here supplied with artificial limbs and it the completion of the training I cd ral agents will assast them in obtaining

positi us One of the devices shown serves to exercise the ankl and lower all It will b noted that the foot which is atta hed to a turn talle lifts a pound weight as it is turned from sile to sil An in lieat it moving over i scale next to the turn table indicates the effort ex p. nded

A similar device is em ployed for strengthening the weakened wrist. The hand is strapped to a turi table and when moved from side to side serves to raise a two-pound weight in direct proportion to the power expended A dial serves to indicate the effort,

so that the strength of the weakened wrist can be con-

so that the strength of the weakened write can be con-stantly measured.

For curning flat feet and stiff legs the devices employed are of the simplest. In the former case the patient walks on two boards slanting away from each other, as shown in the latter case the patient walks with one foot on a steadily rising platform and with the other on a horirontal platform thus causing the first leg to be bent more and more

Ankles may be strengthened by using another device shown which causes the ankle to be worked from side shown which causes the ankle to be worked from side to side A smaller machine whentphens the fingers and wrist. If the patient is unable to turn the wheel which operate this device a nurse does it for him. In the remaining picture of this interesting collection are depicted everal patients exercing their stiffseed hands. The first man to the right is operating a dial arrangement of the control that the control of the control of the control of the control of the chimates any possibility of deceiving the doctor. The second mean is controlled to the control of the control cummares any possibility of acceiving the doctor. The second man is operating a whicel arrangement for strengthening his fingers. The third and fourth men are undergoing finger treatment by means of weight-raising devices. As the fingers are raised and lowered, weights which are connected through pulley arrangements to the gloves the patients are wearing, are moved

Aside from these exercises which tend to restore the Annue from these exercises which tend to restore the patient to a relative state of usefulness from the physical standpoint the Government also provides a course in occupational therapy. This latter course has amply prived its worth wherever it has been scentifically

provided, and increasing importance is being attached to it by physicians in military and other hospitals as home and abroad. It is now universally recognised that occupational work for the convalescents must be suited to the patients condition and graduated to develop normal functional activities and ultimately normal vocational interests and expansities. Such occupational work provides an essential and ecistation means of insuring hypoxid, meantly and ecistation means of insuring hypoxid, meantly and expensive the provides an essential and ecistation means of insuring hypoxid, meantly and complete the provided of the patients of the vocational training school or directly into practical vocational training school or directly into practical vocational tenspie of the patients of the vocational training school or directly into practical vocational training school or directly into practical vocational training school or directly into practical vocational training achool or directly into practical voc

patient's mind on one mistoriume and to keep sum from worrying constantly over his physical handicap. Again, in some instances it is aimed to remind a patient of his condition in order that he will do everything in his power to overcome his disadvantage. It makes him follow the doctor's instructions. So it is evident that occupa-tional therapy has a psychological application as well as

tional therapy has a psychological application as west as appending one.

Take the wearing of baskets, for example, as an agent of functional restoration. The size, shape and weight of the basket determine whether the movements involve wrats, elbows, or shoulders large code and simple weaving require strength and broad movements, rather hand the statement of the strength and broad movements, rather shape with the statement of t

than skill and coordination Raffia and an intricate pattern or stitch involve pattern or stitch involve delicacy and accuracy Fragors which cannot close about a reed of ordinary diameter can firmly grasp one of large diameter. As the fingers are thus un-consciously exercised the range of movement in-creases, and the flagers may progressively hold reads of small diameter Rope or twine in place of reads will sometimes relieve annicular neion and give pliability

to the fingers Whether the patient is ous of work being definitely prescribed to aid his condition or whether he m thinking of occupation as a privilege not interfer with his recovery, the termining of occupe must always be a mest serious sonsultation teresen the doctor re teresen the patient

### World Markets for American Manufactures

Edited by LYNN W MEEKINS

A department devoted to the extension of American trade in foreign lands

#### The Game Is On

AFIFR four years of intensive triming in export trade the United States is ready to incert the chall lenges which its allies in war u.d. impetitors in peace are histening to declare. Until the t rins of peace are settled there will be more er less uncertainty and lack of confidence owing to the h k fad finite foreign trade policy and until such a p h v is formulated there will be a great deal of criticism of the Government in commercial circles Lately Gr ! Britain has announced the replacing on its list of it substited imports of several commedities that did a t require becauses for a while American instufacturers iffected are complaining bitterly the sands of dollars worth of orders being held up and they want to know what our Government is going to de about it. In the rebuilding of the north of France and Belgium at is becoming evident that our nerchants will not realize the titanic fortunes that many have anti ipated that I rance is able to take care of a fair part of its needs and that Creat Britain Switzer-land and Germany will contribute their share the lastnamed in the form of indemnity Toward the end of Ameri an held to ourselves the cotton goods market in Argentina slumping badly because heavy consign ments arrived from several producing countries In the Far I set of course we have had strengous competition for some time

less than a year ago a British engineering firm sent to a prominent American manufacturer an order for steel shects and plates writing that lowing to war conditions, we are willing to waive the usual terms of payment we are withing to whive the usual terms of payment against documents at Liverty ool and we have a confirmed credit with our bankers in New York against which you may draw upon shipment of the material I pon receiving a reply to the effect that the American com pany required each with order our friends across the sea hastened to voice their disappentment. You blawsted hastened to voice their duapir intment. You blawsted
Yankees may hold us up now they raved but wait
until this blooming war is over. The di mands of the
firm in the United States, however, were based upon good and sufficient reasons. To manufacture those sleets and plates a priority order had to be obtained to trans port them to the scaboard a railway shipping permit was needed to send them out of the United States an was needed to send their due of the clinical states an export hiense had to be accured. If the order happened to be annelled before, the shipment reached New York the manufacturer would be involved in serious difficulties. And hi was not compelled to run that risk because he had enough business to keep his mills running 24 hours a day

#### Trade Handicaps in Wartime

There have been many instances of the failure of foreign importers to understand that American exporters have been encompassed by a veritable maze of regula-tions and restrictions and numerous complaints have arison reflecting unjustly up nour commercial practices.

A man in B icnos Aires pr tested that he had paid in advance for a consignment of jewelry Six months elapsed and shipment halyet t be made The explanelapsic and shipment haryet to made. The explan-ation was simple no resent could earry it the few steamers on the River litte run leng needed for es-sential cargoes. There were numerous cases too in which an order with or without a remitance came from abroad to an American firm that was unable to acknowl edge its recept it auss of jostal and cable censorship and invarially the fireign system endemned that firm often other American bisness men as well Nothing is more injurious to trade than delay Mar

kets rise and fall conditions change buyer and seller drift apart so it is our misfortune that aithough the United States has been the principal source of supply, and in most part the only source of the wild s needs in manufactured hors it has not been easy to purchase from us Now that the clouds are I livning over it be hooves us to remove all these difficulties and to make it decidedly worth while for our Furopean and Assatic and South American cousins to patronize our well stocked store We shouldn't go to the extreme of ramming erchandise down their throats or to the extreme of sitting back and doing nothing but the thing to do is to send salesmen to describe the advantages of our products and to back them up with real service

#### Making Better Products at Lower Cost

The mechanical ingenuity of American manufacturers is an advantage that weighs heavily in our favor. Up to

1914 a New York Importer brought in large quantities of theap cuttery from Germany Most of this con-suited of pocket knives that could be imported at a much lower cost than the prevailing price of American-made knives of the same grade When the German supply was cut off the importer bought a small plant in New England and began to experiment with the result that, despite the very high cost of steel he succeeded in turning out a better product which he could sell at a lower price than he had received for the German knife before the war Another example is even more striking Until recently the United States has not been an exporter of earthenware. An Ohic manufacturer skill-fully adapted hard-baked porcelain to large scale pro-duction and managed to land his goods in South America. more cheaply than the German manufacturer used to deliver them from Hamburg

The British have been successful in foreign trade The British have been successful in foreign trade largely because of their patience remarked an American just back from England They say that we are to anyou to make a quock turnover and dunchmed to the up our capital. This is advanced as a serious obstacle to the carabalhament of the galakth industry in the United States. That product, as incombustible substitute for ivery and celluloid come from summed milk and the thecker also require many months in which to have a recovery the summer of the summer harden properly It was made originally in Germany, now Ingland is manufacturing it on a commercial scale Attempts to produce galaith in this country have failed because the necessary capital was not forthcoming. The American export commission house thrives because so many of our manufacturers want to convert their goods into cash as soon as possilic and do not care to wait until their products reach the foreign merchants to whom the shipments are consigned

to whom the shipments are consigned. The feeling in American manufacturing circles that the Covernment is not adequatily supporting our area of the covernment is not adequately supporting our results of the consideration. There are, inclusive of meeting the moves of our competitors—by relaination and by bargaining. We have the nicessary machinery in the War I rade Board the Shipping Board the Federal Reserve Board and the Department of Commerce: The effectiveness of these agencies has shready here demonstrated by the control of the control strated When the British began to cut ocean freight rates the Shipping Board did likewise meeting cach reduction promptly In the War Irade Board we have an instrument for combatting unfair restrictions of imports and exports by other nations the Federal rve Board is having something to say about the exchange situation | Finally the Department of Com-merce is sending to all parts of the world as trade com missioners trained business men to seek new markets for the products of American factories. Such representatives in the past have diverted millions of dollars worth of orders to the United States

#### American Shoes Favored in Italy

seems strangely appropriate that the country shaped I assems strangely appropriate unat the country summers like a boot in a growing market for the American shoe manufacturer and just as Italy a toe dipped into the Stratt of Messina, is rounded, so do the Italiana his position comfortable footwar and shun freak fashions. Mena shows and laborate and shape and laborate and the stratter of the stratter comtortable footwear and snun ireax issued in order and latest and women s lines of typical American shapes and latest conservative styles are sold to the exclusion of shoes built on an exaggrated swing last or with an extremely

Before the war great quantities of shoes were supplied to Italy by Germany, and at a recent meeting of repre-sentatives of American factories the question was raised whether German firms had much chance of regaining their former hold 'From our experience I don't thin

their former hold. From our experience I don't think they have for a while sayway said one of those present. The manager of our branch in Milan is an American citizen but he name is German. Shortly after Italy entered the war an angry mob set out to destroy every-thing in the city connocted with or suggesting the Tea-tons. Our man had to invoke the said of the American consult in city of the American consult in city of the American

tons our man had to invoke the aut of the American consul in order to save our property.

Milan occupies the same place in reference to business in Italy that New York holds in the castern part of the United States It is the banking, credit and merchanin Italy that New York holds in the eastern part of the United States It as the banking, credit and merchan-dising center. To comprete permapently in the Hailan market, American manufacturers should have agincies there Italian testes abould be studied, full lines of samples above, sufficient stock carried, delivery guar-anteed within a reasonable period, and, above all, liberal credit granted to established and reliable irras

#### Greater Comfort Afforded by Our Facts

Greater Comfort Afforded by Our Feetweer

'As to the comparative ment of the American and the
Fnglish shoes sold in Italy, said a man familiar with
the trade, our footwers up of more attractive design
and affords greater confort, while the British product is
provided with better sole leather and stands longer
wear, making if more salidatedry Nevertheless,
American shoes are in strong demand owing to their
supernorty of workmandup, finish and style.' The
popular better and the stands of the supernorty of the supernorth of the sup

know that few bootblacks outside of the larger dites are provided with yellow point.

During the period of the war the United States furshabed to Italy from four to five times the value of our normal share of imports owing to our ability to supply goods in larger quantities than other sources. In connection with plane to keep a fair part of the Italian above business it is interesting to note the methods employed business the interesting to note the methods employed business the interesting to note the methods employed business the interesting to note the methods employed to be former in desling direct with retailing a supply of the former in desling direct with retailing and a saving of middleness profits to the consumer and in a wide distribution throughout the kingdom. English makers are particular to meet Italian tastes in shares. an a wide distribution throughout the kingdom. English makers are particular to meet Italian tastes in shapes, siyles and weights. The Germans used to send traveling asslemm on requisit trips to open credits and collect bills due. Advertising matter in Italian quoting prices in Italian currency delivered in the town was employed for trade development. C o d packages were accepted by the German postoline suthentities.

The large numbers of Italians now returning home from the United States will augment the demand for American goods in Italy and at the same time improve standards of living They will make fun of their country-men who go barefooted and the latter will purchase shoes in order to be as well-dressed as they are Although there is a growing shoe manufacturing industry in Italy, supplied mainly with American machinery, that country will be a large importer of footwear for many years

#### Honduras Needs American Agencies

If the United States is to retain anything like its present share of the trade of Honduras said a recent valid for the guidapla several general morthandsamp houses under strictly American imagement should be ordalished without dolay. The country is about as large in area as Cuba and although the population is probably not over 600 000 the market is worthy of doser probably not over 600 000 the market is worthy of doser attention than American exporters have given it Amapala the only Pacific port of Honduras which sup-plies all the territory between the borders of Salvador and Nicaragus, as well as the capital, Tegucigalpa, there is no place to buy hardware, farm machinery, motors is no place to buy hardware, farm machinery, motors gasoline sagness and other general lines. This business was formerly dominated by four powerful German inport and export bouses which maintained numerous branches. Unless American segrecies are placed in Annapais to handle imported American merchandies, for which there is a ready market, this lucrative trade must resum eventually to German hands.

return eventually to uerman nands
"Gradually the Hondurans are adopting foreign
manners and customs in living and dress but there are
few American stores, beds, bathtubs and other house-hold goods in use Many articles that Americans con-sider necessities are not soid yet the fact that nearly every
handle home has a serving machine and many breast sidor necessation are not sold yet the fact that nearly severy humble home has a sewing machine and many houst a phonograph indicates that the people are becoming more progressive. Typewriters and coak registers are quite common, and wherever roads exist the automobile has been introduced. There as a demand for American footwear, high-heeled and ornamental shoes being preferred, and for rubbons, embriedieres and leave. By keeping up the present standard in quality, granting liberal credit and exactly to combring a with readeins memory and exactly interpretable and exactly the readeins memory and the reader of the reade and carefully complying with packing requirements, American firms may hold Honduran bunness, but they must be more adequately repre

#### Making Two Destroyers Into One

THE destroyer "Nubian ' of the British navy while THE destroyer "Nuosan of the smissa navy wante in partic, ran into a mine (probably when the stern was swinging over as the boat was turning) and the after-half of her was blown to pieces Fortunately the attended her builkheads was good and tough and the riveting well done, with the result that the forward half of the vessel remained affoat and was ultimately towed to a dockyard

Another victim of the war was the destroyer, ' Zulu Another vacuum of the war was the destroyer, 'Zulu which touched off a mune that tore the forward third of the vessel spart and left it looking like the proverbial "pile of sorsp iron. In this case also the bulkheade beld and the salvaging vessels were able to tow the

after-part of the "Zulu" to the same dockyards in which the 'Nubian' had found refuge

It is one of the fortunate circumstances attending the wrecking of ships by mines that the action of the high explosives is so swift, that it blows in the portion of the ously affecting the resi of the vessel, that is to say, a of the vessel, that is to say, a vessel may lose bow or stern in fact may have it cut absolutely away and still remain water-tight through out the rest of her structure This is what happened in the case of the two stricken destroyers, and all that was necessary was to cut away the wreckage, float the two destroyers (or what was left of them) into the same dry-dock, line them up to a common longitudinal axis pump out the dock and proceed to fill up the gap between the boats with the necessary scantlings, plating etc Fortunately, they were sister boats of the F Class the Nubian being built by Phornecraft and the Zulu by Hawthorne Fach is of 1,000 tons displacement and

38 knots speed
In christening the nautical
liamese twins that had been thus produced, the Admir combined the names of the original two vessels call ing the new ship Zubian

#### The Mystery of the Boomerang By P. A Valle

THE boomerang is the of an airplane volplaning to carth

Everyone has seen the con jurer flipping his cards out over the audience so that they return to him The reason for their coming back reason for their coming back in, in the first place that they are spinning. Every spin ing thing trees very hard to stay in the plane of its rotation. That is why the top stands up and goes to sleep. That is the secret of the gyroscope, the scientific toy we all admire

The cards obey the same law

If they had no spin

The cards obey the same law I they had no spin they would fall as strught as they could to the floor, slipping in the art first one way, then the other, even as a convenient in swell of the card must obey the law of avaritation, but it is so light, and there is so much fraction of the lower side, that it has no choose other than only he card must obey the law of gravitation, but it is so light, and there is so much fraction of the lower side, that it has no choose other than only he card must be considered by some steps had of ice. It is resting on a medium to deman for is to peakerste in anything approximating a Thak, height; is the extipaciation of why the boomerang counts fastly, The implement, we can cause so, consists

of a piece of bent wood quite flat on one side and raised or curved laterally on the other. It is grasped firmly at one extremity and thrown away spinning so rapidly that it is practically reduced to a circular plate of wood of

diameter equal to the straight his poining the two ends. If we were to reduce the wind in the boomerang to a circular plaque of the same diameter, this would evidently be very thin We should have then in effect a circular wooden card but it would be so light in proportion to its superficial area that it would be practically worthless for throwing In the boomcrang n the other hand we have the concentrated weight for throwing yet we get the effect of the plaque or curl hin the rapid spin

restricted fall. In the one case the plane is a fixed and permanent apparatus with a definite area of sustaining irface in the other the boomerang presents a movable and varying quantity which by its speed of rotars motion makes up for its la k if superficial area and for the local mobility i its a istaining surface

So much for how the immerrang mess back I have said nothing of how it go s away it may seem rather like putting the eart befor the hise i d al with these two aspects in this order but it fit is the great myst ry of the boomering has always been its return flight Its outward journy alvers seemed natural enough even to these who hil not un kestand it for it

went the way of all things thrown away from the threwer there are how ever several phases of this mtwar i flight that are quite ntcresting

I have referred to the I somerang on its return as in example of an airplant volplaning to earth Ou ite nitward journey if is a good simple of a plane climbing but in this case the engine that is the power of the

A consideration of this leads one to inquire whether it would not be perfectly teasible to build an airplane on the principle of the boom rang This would mean a flat plane or wing revolving on a vertical axis in a nearly horizontal plane. This ma approximately as the boom rang and having its virtical shaft fixed to the plane as nearly as possible at the caset center of rotation would if driven by a suit able engine fly and rise as surely as does the boom rang. It would be merely i questin of alculating the occessory superficial area of the plane and the deficience from this figure which would be permusuble on account of the retation

I have said that the plane might be flat but it would probably be found dearable to have the outside edges or the ends of the boomerange hane so curve i that in som ning at a high tate of speed th y would produce the effect f a shallow disc as in the latter as most people know is an inverted saucer and i is an inverted source and a very good airplane on who has long as the spin lasts and the power of the trap that eje ts it is felt arries its own gyroscopic stablizer. It would seen that this curved end to the boomeras g plane would tend to preserve the normal ass plane lines and so to produce the vacuum upon which we are assured so much of the otheren y of a plane depends Not the least puzzling part boomerang is the manner in

which its plane of rotation to approximately horizontal Pages of Luchid and of algebra have been offered in elu ilstion of this point pages which I find much less convincing than the very

pages which I mid from ress continuing that the very simple dea which I propose now to advance. The pull of the right hand and arm in throwing the boomerang is invariably inward. That naturally lays

boomerang is invariative invarid a nationally lays the plane of spin of the boomerang a little outward.

Everybody has seen how the boy s peg top hes over at an angle until it finds its most constant axis—the at an anguluturi it must its most constant axis—invertical one—when it goes to sleep. It is in my opinion,
somewhat the same with the boomerang in the sir as
with the top on the floor. When the boomerang goes (Continued on page 188)

Salving in the bows of the Nubian' after being mined

Stern of the Zulu being towed home after the bow had been blown off

The two portions put tegether making a new destroyer under the name "Zublan"

effects the distribution the world over the arcle
The boomerang, therefore comes sming back to the
person who threw it; excell, as an araphase volplanes
back to the earth. But to get the idea clearly we must
magne the arrplane, instead of the ordinary wings to
have one or more large flat arms so placed that they
consider a manuscription arms section of the ordinary. represent a comparatively narrow section of the original plane, and revolving at a high speed. If this idea is

carried out, we have a perfect analogy to the return flight of the boamerang The phenomenon contists simply in the return of an object to earth in obedience to the law of gravitation, through a medium thick enough to prevent its un-

#### Device for Transporting Kegs

Will N a heavy keg is to be moved the usual way is to dump it end over end or roll it a system which often causes a lot of dringe to the kegs and their contents besides being hard in the back of the man whese job it is to move them about the envey there ilhandles the heavy legs it as a vinioner saving time and lift r. The investoria saving time and like. The inveverse shoved up close a gament that then of the INVESTER 18 keg and n wirel cj attach dit the device is thrown over the keg. He handle of the conveyor is then be night backward with a siddly missement which lifts the keg from the floor The loop of course, is essential in keeping the load from

I has simple device has proven of great value where rapid transfer of kegs is desirable. It is fair to assume that the desirable saving of time and later together with the added economy resulting from clim-mation of damage should pay for the installation of the conveyor

Improved Method in Photomicrography

FROM a British source comes the following in teresting and valuable suggestion as to an improvement taking photomerographs of steel that is photographs of the magnified area of the crystalline structure of iron

In the ordinary vertical camera in which the plate supported at a distance of 10 inches or more above the microscope the length of the

focusing screen is often the source of much memory nence a further difficulty which is suspended in order to chiminate vibration arises from the oscillation which almost mevitably occurs when the dark slide is It was suggested that to meet these diffi ultres a means might be found of reflecting the beam herizont illy and so adjusting the focus without the use of a our d glass in the usual position. The telescopi arrangement here described was designed for this purpose and refocusing cunera. A similar device has been adopted in the Le Chutcher injero scope and camera but in spite of its generally known in this country

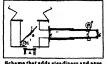

I be construction of the apparatus which might be attached to the front f my camera is shown in the illustration where the broken lines incheste the path of a learn which converges to form a point in the image. Rays proceeding from the interoscope eyepice A which would normally converge to a focus on the photographic plate are reflected borrontally by the inovable mirror B this mirror is attached to a metal plate large enough to cut off all light from the camera when in the position shown and camera when in the pesition shown and as prevented from p wang beyond the 45-degree position by an adjustable stop attached to the signale. He deflected beam is focused by the tels scope objective E (focal length, four meles) upon the cross-rines F, and the image so formed as even, together with the cross-wires, when examined through the sys-lam C (focal length, 3/ useh). The magnification thus obtained is about the same as that

given by the use of a hand focusing k na upon (or without)

will be seen that to cach length of camera there corresponds a fixed nt I to which the cross-wires must be set by pushing in the dring tube and

the up ing tube and closing the claimp H. It is convenient to graduate the shding tube by direct comparison with the ground-glass, in numbers representing the corresponding camera-lengths When this graduation has once been made, it is sufficient, in taking a photograph, to fix the tolescope for the proper camera-length and focus the microscope so that the image is clearly defined on the cross-

wires Ar soon as the focus is ascertained factory, to be steady and satus-

Scheme that adds steadiness and ease of focusing to photomicrography

which is a common plane galvanometer mirror though the best result would no doubt be given by a silvered right-angled prism I or ordine purposes the sample form described has proved sufficient and represents a consider able saving of expense in comparison with the more correct construction

lens, and no doubt the full field could thus be obtained, at

the same time it would certainly be well to make the ob-

ective achromatic

found to arme from the use of the mirror,

### Electrically Heated Food Truck LOSPITAL trucks which are elec-

Wheeling kegs instead of rolling them

types and have proved quite satisfactory in working, the field is, however, rather narrow about one-third of the diameter photographed being visible at once It managested that the eyepiece of the telescope might be provided with a field-

vertical position The lenses described are of the simplest

to be served with hot food. So often to be served with not lood so office where the kitchen is at a distance from the rooms the food gets cold before the trav comes to the patient This electrically heated truck has done away with that decomiort

The truck measures 61 mehes long 30 inches wide and 63 inches high and con-tains 15 travs It is built of Russia Iron with galvanized iron inside lining, and it is insulated with asbestos. The truck is mounted on broad rubber-tired wheels

ere concern begins and ends. From the rage recovered from the mile beausant reach railroad there is extracted gains for the ears, its addition to other flows.

which makes it easy to push from reom to room without the slightest nose. It is heated by the ping and over consection made on each floor where the truck stands a few minutes waiting for the attendant to deliver the trays to the

The use of this truck will bring supp-fort to the stok people who find it bard to relish the half-cold food that is often

#### Eliminating a Railroad Waste

"HF war has developed in a singular way the ingenuity of the technologists away the ingenuity of the technologues of all nations, who have been called upon to repince, by equivalents that can be obtained, materials which have become scarce or altogether unprocurable By wittue of the constantly tightening Allied blockade, the German industries re the first to tread this path, and the Hun chemists have developed many an 'ersats," from war broads and aqueous solutions of dextrine for use as table oils, to elastic bandages without

a trace of rubber But little by little, France and Eng-land and the United States have had their attention drawn to the better utilisetion of manufacturing, agri-cultural and mining residues which heretofore, through ignorance or negligence, have en allowed to go to waste. And now that peace has re-turned, the question of economy remains a live one to every member of the business and industrial community Utilisation to the spirit of

the times, and in this spirit M Alexander Grison, shief enganeer of rolling stock on the Para-Orieans Railway,

has just worked out an original method of treating the rags recovered from the of treating the rags recovered from the surb-boxes of his cars. These cars are equipped with boxes in which peoples greaning ascended by means of a packing of wooden waste in direct contact with the axid-trees. Every three or four mouths the ears go to the maintenance shops, primarily for time repairs; and at each viait the rags are removed from the axid-boxes and replaced by new Pre-viously the old rags had been discarded sitogether, with a naturall aloss of the textile strell, as well as of the oils and greases that if carried. present that it carried

present that it carried.
It is the loss that M Orseon has exceeded in eliminating. The technical details of his process need not be discussed here, since they comprise little mere than an uninteresting section of bodings and dryrups and flierings and dryrups and flierings and discussion in an intermination element of the section of the section of this, after by me approach the sections this, after by me approach the section of this, after by me approach the sections this, after by me approach the section of this, after by me approach the section of this, after by me approach the section of the secti dition that they may go back

axis-boxes instead of into the ter.

The shop in which all this is is a small one, costing but a few if rance for installation, and requirements on the constant of the same to operate it. After a sary observes.

"Take Up" instead of "Wear Out" Suppose that valves couldn't be ground when they got leaky Suppose there wasn t any spring to piston rings

> Suppose bolts couldn't be tight ened up after they worked loose

Trucks tractors and motor cars would be mighty short lived if it wasn t for take up here and at other points where wear goes on Rattles and pounds would soon develop to tear them to pieces

In the bearings which always have to stand a lot of hard knocks and important The take up feature of the Timken Roller Bearing enables you to make a brand new bearing of it at the end of every season All that s needed is a part turn of the adjusting nut or removal of a shim

Another important thing that Timken Taper does for the tractor, truck or passenger car in wheels, differential and other points of service is to take end thrust just as well as downward load

Because of Timken Taper Tim ken steel and workmanship Timken Bearings not only resist wear them selves but they protect and extend the life of other important working parts of the machine Learn more How Can I Tell?

# Born of war's necessities

The war proved conclusively that the magneto is the only form of ignition that is thoroughly reliable under all conditions. It is the only system that does not demand constant attention. It is the only system that does not require costly renewal every few months.

The AERO is the magneto in its highest perfection. This magneto of unequalled reliability and efficiency was developed by Splittforf engineers to meet the war's needs

from all the uncertainties and all the faults of battery systems

As standard equipment on airplanes of the U. S. and Allied Governments, the AERO Magneto won new laurels for magneto ignition and forever settled the question of whether battery ignition can compete with the magneto for any ignition purpose where

for an ignition system that should be free

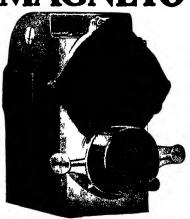

FIRST cost is not the main consideration.

The AERO Magneto is now available for passenger cars, trucks, tractors, motorcycles and all other internal combustion engines.

#### The Principles of Camouflage

(Continued from page 162)
decreasing the visibility of airplanes at present as viewed from below as to increase, the brightness by the diffuse transmission of direct sunlight on clear days. On over cast days clouds and hase must be depended upon to screen the craft

#### Sources of Light

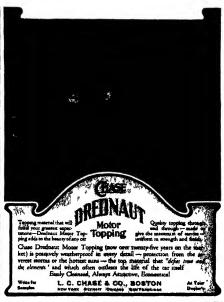

In considering these aspects it is well to recall that the two sources of light are the sun and the sky Assuming the sun to contribute 80 per cent of the total light which reaches the upper side of a diffusing surface at midday and assuming the sky to be cloudless and uniform in brighties then the brightness of the horizontal si face will equal 5 RB where R is the flection factor of the surface and B is th nection factor of the surface and B is the brightness of the sky. On an overcast day the brightness of the surface would I equal to RB. Now assuming R to be the mean reflection factor of the earth this the lower side of a horizontal opaque sur face suspended in the air would receive light in proportion to RB If this low r surface were a perfect mirror or a perfectly reflecting and diffusing surface its bright ness would equal 5 RB on the suray day and RB on the overcast day. The surface overcast day its brightness will be a fra tion (less than R) of the brightness B of the Inasmuch as R is a very small valu if is seen that low vincinity or an incident viewed from below can not be attained in an overcast day it can be approached on a sunny day and even realized by adopt ing the expedient already mentioned With this beginning the reader can make further computations

Seasonal changes present no difficulty s mer and winter need be considered. If the earth is covered with snow an airplane covered completely with white paint would Covered completely with white paint would be fairly satisfactory from all viewpoints. The white paint would possess a reflect is factor about equal to that of a sw the providing low visibility from above. asmuch as the reflection factor of snow is very high the white lower sides of an a plane would receive a great deal of high and would be of low visibility from below ()n clear days when the background was the but say the lower states of the craft an ind be tinted line. This of course holds for a similar consideration in preceding pars graphs but color has not been considered in this discussion be a see the chief difficulty in obtaining brightnesses of the prop r order of magnitude. In winter the barra ground would be of the same color and reflection factor as in summer so it would net be lifticult to take this into considers

Seaplanes whose he kgrounds generally consist of water would be painted of the on) r and brightness of water with perhaps a slight mottling as this is always better than solid color

#### Invisibility at Night

Aircraft for night use would be treat in the same manner as aircraft for day us if the moonlight is to be considered dominant factor. This is one of the case dominant factor. This is one of the car where the judgment must be based a actual experience. It appears that it great enemy of night raiders is the searchight. If this is true the obvious expedient is to paint the craft a dull jet black periments indicate that it is more difficult to pick up a black craft than a gray or white one and also more difficult to hold it in the beam of the searchlight an be readily proved by the use of black an ne readily proved by the use of black gray and white cards in the beam of an automobile headinght. The white card can be seen in the outskirts of the beam where the gray or black cannot be seen and where the gray or black tannot be seen and the gray can be picked up where the black one is invanible. The accence of vision accounts for this as it does for many other questions which arise in the consideration of eamouflags or low visibility Some attempts have been made to apply

the principle of confusibility to airplanes as finally developed for vessels to circumvent the submarine but the felly of that appears to be evident Air battles are conducted at terrific speeds and with skilled maneuvering Triggers are pulled with-

out computations and the whole acturity is almost lightnan-like. To expect to confuse an opponent as to the ocurse and position of the airplanes folly. The came unlage of observation balloons has not been developed though experiments were being considered in this direction when the war closed Inasmuth as they are low ultitude craft it appears that they would be best camouflaged for the earth as a background. Their enemies poused down upon them from the sky so that low visibility from above seems to be the better choice.

In the foregoing it has been aimed to give the rader the general underlying principles of the visibility of surplanes. As stated there is a vast amount of data available upon which the development of low visibility for arriplanes could be founded Rowever inassuch as the war closed before a systematic development was achieved practical examples which are Full patter can not be done this subject in a five paragraphs but it is looped that there has been presented a broad view of an extensive subject. In the foregoing it has been aimed to give

#### The German Art of Make Bolieve C nimumi from page 180)

and fitted for breadmaking The cultivation of lupine demands very little care and no fertilizing while its roots enrich the soil to a very high degree with nitrogen

soil to a very high degree with nitrogen
Among other economic discoveries is a
process for making a cament substitute
worth while notiring Common building
line is so treated that it has the same
quality as cement on hardening in water.
The new material has been extensively used
in smaller residences has been found much thesper than cement and seems to prove a valuable and cheap substitute for cement

The eagerness with which Germany has turned to the many substitutes which have been put upon the market has naturally resulted in many disappointments as well as many valueless articles. More than 700 substitute materials have been for bidden sale and use by the Government authorities and numberless others have been refused heense

Taking the substitute materials as a whok one can say that however valuable they have proved for the time being, they can not in the future make up for the im ports of raw stuffs Germany will require nd they can not free Germany from her foreign economic dependency

#### The Mystery of the Boomerang

(Continued from page 178)

to sleep it has found its most constant axis of rotation after a preliminary struggle around what I may call for popular ex-planation its irregular or eccentric ap-

planation its irregular or eccentric ap-proximation to a steady axis of rotation. There remains still to be explained the curve to the left at the end of the outward flight of the boomerang which immedi-ately precedes the great volpiane back to the thrower. This is think, can easily be accounted for on the principle of swerre, as shown in the case of a spherical object in the air or a nurine-stome on the ice. in the air or a curling-stone on the ice

This well-known principle is that the ball edges away from the side that is re-volving toward the point to which it is traveling. On that side the motions of traveling On that side the motions or progression and revolution coincide, that is, they are both forward while on the other side the revolution is backward With greater forward velocity and equal weight on the forward spinning side, there weight on the loward spinning size, there is consequently more friction on that side, and as a projectile always seeks the line of least resistance, the boomscrang, like the ball naturally edges over to the side that us spinning backward It may even be that this is the main function of the

# Breaking Shipbuilding Records

From Seattle to Philadelphia the stutter of thousands of pneumatic riveting machine rends the air. White hot rivets under the feverish urge of compressed air holt plate to frame. Soon another hull takes the ways and adds to Uncle Sam s ship tonnage.

Trailing serpent-like from the riveting "guns to the compressors are long gray lines of United States Pneumatic Hose Air tight and kinkless it is, delivering every ounce of air that the pumps register

In those dark days when the Bridge of Ships was the one vital line of communication between our shores and the Western Front, American shippards responded with record-breaking launchings

Spark counted for most But it will not be demad that United States Pneumatic Hose was a very important factor U S '4810 helped make those riveting records possible

Light strong and flexible it follows the riveter and his bucker up wherever they go Dragged over rough places trod upon by man and horse, run over by cart and truck its all in the day's work 4810 stands all kinds of abuse, without bursting or getting flat

The United States Rubber Company makes good Rubber Hose for every purpose -air gas steam, dredge fire garden, etc

Tell your hose problems to our ne rest branch They will be thoroughly analyzed by specialists and recommendations owered All without involving the slightest obligation on your part

Your assurance of superior service is in dealing with the largest rubber manufacturer in the world, whose quality mark is the well known U S seal. Let that seal guide you in all things pertaining to good rubber goods.

other things being equal the crumb will remain fresh and soft and retain its flavor if the surrounding temperature be kept at eixty to seventy degrees Centigrade (140-158° F)

Mr Kats found by direct experiment that bread taken from the oven and kept for 48 hours remains fresh or grew state

ing manner
In all instances if the temperature did n it fall below 60° C (140° F) it remained perfectly fresh while at 50° C (122° Γ) it began to get stale and the lower the it began to get state and the lower the temperature the more lapid and the more con-licte was the change to staleness reaching its maximum at about 2 below sero C (286° 1) (slightly below freezing point) Most unexpectedly however as soon as this point is passed the bread immediately shows a tendency to become fresh once more At 8° C below sero (176° F) it is only half stale while when the temperature of liquid air is reached it is absolutely fresh though naturally it can not be said to be edible. The practical conclusion to be drawn from these curious experiments seems to be that bread should be placed in some receptacle such as a fireless cooker for example immediately on being removed from the oven where it can be kept at the required temperature

until required for use

It seems possible that the problem of
workless Sundays for bakers might be solved in this manner

#### Syrup from Grapes

DURING the agretation for prohibition in California one of the really vital problems concerning large sections of the state was what to do with the immense

There are large areas of land in Califor There are large areas of land in Califor ms on which little else but these grapes will grow so the problem was how to prohibit the manufacture of wine without bringing undue hardship on the people engaged in growing the grapes are considered fit only to be on verted into wine.

The Areantistical Californ of the Illing the control of the Illing the Illing the control of the Illing the control of the Illing the control of the Illing the Illing the Illing the Illing the Illing the Illing the Control of the Illing t

verted into wine

The Agricultural College of the Uni

versity of California took up the problem
and has devoloped in its laboratory a

practical method of converting grape juice
into excellent syrup—an article so much
in demand in these days of sugar conserva
tops.

The University claims that the conver mon of grapes is to syrup instead of wine will double the value of the grape crop of the state that the 259 000 to a of grapes now worth \$4,000,000 whose market will be cut off by war prohibition in 1919 if made into syrup would be equivalent to 40 000 tons of sugar of a present value of \$8 000 000

At the same time an independent chemist aid grape export has succeeded in produ ing a syrup from grapes which is declared to n set all the requirements of a practi al con mercial syrup According to figures which he submits his method will product svrug at a slightly less cost

One of the most interesting fratures of One of the most microting fratures of that question as the plan recommended by the University that all grape growen winerse and squar factories cooperate next year in the interest of all these in dustries it proposes that the winerse purchase the grape of the vintage of 1919 and extract and store the estimated 50 000 000 gallons of purce the larger control of the 
will prevent fermentation for a year in necessary The bulletin states that this syrup can be used in place of sugar in preserving some fruits and mixed with sugar for others Not only will grape growers and win-

#### The Economic Effect of the Loss of Alsace-Lorraine

THL economic loss to Germany involved decursed by Dr Felix Pinner, the financial editor of the Berliner Tageblatt, in a recent that the acceptance of the terms of President Wilson has given an international aspect to the Alsace-Lorraine question and suggests that it might be worth examining the economic value of that territory to Germany He points out that Alsace-Lorraine is not only one of the most highly developed manufacturing parts of Empire but also, what is more important, one of the chief sources of raw materials with which Germany is not any too well supplied

The mere loss of a manufacturing indus try, no matter how highly developed, is far less serious than the loss of a supply of raw materials Manufacturing industries bas largely on foreign raw materials may be easily trunsplanted, the productive forces, cashy transplanted, the productive loves, the capital, the enterprising spirit, the technical training and commercial con-nections involved are comparatively mobile and may be restored after overcoming a and may be restored after overcoming a certain amount of disturbance during the period of transition. The loss of raw materials, on the other hand, is final and irreplaceable. The mer mention of ore, potseth and petroleum is sufficient to indicate the significance of Alsace-Lorraine as regards to raw materials

As to pstrokum, Alsace produced prior to the war 42 per cent of the total amount of 120 000 tons of crude oil produced in Germany, and while the yield has increased somewhat lately, it is still of slight importance as compared with the total German consumption of petroleum. The potash deposits are of far greater importance, both in economic and politico-economic point. It is true that the potash etandpoint standount it is true that the potsen deposits in the other parts of Germany are more than sufficient for domestic consump-tion and export. But the loss of the Altion and export But the loss of the Al-satian deposits (about 10 mines belonging mostly to the German potash syndicate) will deprive Germany of the world monopoly which it has heretofore enjoyed and take away from it one of the few weapons of economic defense

New York, M. Y.

While the statements in the Allied press to the effect that the Alsatian deposits will be sufficient to provide potast for all countries outside of Germany may be exaggerated, the fact remains that the loss exaggrated, the fact remains that the loss of these deposits is of extreme importance. The potash monopoly, the writer asserts, enabled Cermany not only to fix the prices for foreign markets above those for domestic consumption, but also to offer an important product in exchange for raw materials produced by countries depending on German potash The loss of the Alastian

ing development of the German iron and steel industry would be untblinkelike. From a few million tone the German iron and steel production increased within the two decades preceding the outbreak of the War to 19,000,000 tons, far outdistancing the Britain production and bump [0,000,000 tons behind the American production The importance of the Lorezine deposits is not indicated by the iron and steel produc-tion of Alsace-Lorraine (2.288.354 tons). tion of Alsace-Lorraine (2,289,354 tens), but by the fact that the entire from and steel industry of the western part of Germany, particularly in the Rhomsh Westphaths and Shar distrots, depended to a large actent on Lorraine numette The Lorraine and Luxemburg mines (the Luxemburg mining industry being closely connected with that of Lorraine and the separation of Lorraine will probably mean the loss of Luxemburg as a member of the German Customs Union) supplied in 1913, 28,500,000 tons of iron ore out of a total of 35,000,000 tons for the whole of Geror 35,900,000 tons for the whole of Cer-many, or 77 per cent on the base of metallic content. The loss of Lorraine would, therefore, mean that for a large part of its iron-are needs Germany would depend on from needs Germany would depend on foreign countries, while in 1913 it imported foreign ore from Sweden, Spain, Russis, and, perhaps, even from France, but the narrowed to such an extent as to endanger

its maintonance and further development. In considering the Alsace-Lorrance side of the question, Dr Pinner points out that the restoration of that territory to France does not necessarily mean the transfer of Germany's position in the iron and steel industry to that country. It is claimed by the writer that France has neither the by the writer that France has nother the organizing ability for large-scale industry mor the fuel supply required to maintain as extensive iron and steel industry. He sites the backward state of development off the De Wendel buildings in Lorraine, recently confined by Cermany, as proof of the lack of enterprise on the part of the Franch holders of ere deposits. He also states that in spate of the fact that the Franch portion of the minette deposits was larger than that involved in the loss of Lorraine in 1871, the iron and steel industry of French Lorraine could not stand in comparison with that of German Lorraine Only a small part of the ore mined at Bries and Longwy was used in France, and t and Longwy was used in France, and the remainder was exported in a raw state. The writer admits that this was not due entirely to the lack of enterprise on the part of the French industry, but partly to the lack of coke, and calls attention to the arrangement in effect before the war-by which German coke was exchanged for French ore. The transfer of the Lorraine iron industry to France will still further increase the French demand for coke, and although some French writers maintain that the requisite supply might be obtained from Great Britain, Dr Pinner points out that it will not be to the adpoints out that it will not be so this acreamage of that country to further the development of a rival industry in Lorraine, even if it should belong to France.

#### Airplanes and Seas Navy in Wartime

THE activity of arribanes and seaplanes
Tued by the United States Navy during
the war for overcoming the submarine
menace is one of the most interesting
chapters of history about which, for
"tactical reasons," little has been published
to date Now that the war has been wen,
however, naval officers are actisfying the
washes of interested organisations by however, naval officers are actualying the wishes of interested organisations by describing and illustrating just what has been done to make America's participation in the war so officetive At the annual meeting of the Society of

independent export policy of Germany as At the annual meeting of the Society of regards potach and will farcs it either to New York, Commander H O Richaedson, set privace or enter an agressment with the U S N, presented a highly instructive The most severe blow will be the loss of the iron-ore deposits. It is east to state the third that the solution of the Lor-Society are commented, of the Particular Comments of the privacy of the property o

## After the First Real Test

After the end of its first season of hard service—after your motor vehicle has traveled 3000 miles or so—after your tractor has plowed harvested and threshed after wear has begun to cause looseness here and there—

Then comes the real test Up to this point most electrical systems do all that is required, but beyond only the best can possibly be good enough

The doctor's car then, if ever, will show signs of weakness that his mari mum demands—frequent starts, short runs—would emphasise in the system that supplies current for starting, light ing and sgntion

The long haul truck will have de veloped some electrical weakness unless its equipment is built to stand long trips over rough, difficult roads

The tractor in particular will by then have shown in its hard field work, if there is lack of proper design and con struction of its electrical component All three of these services mean short life for the battery and a short road to a crippled electrical system unless generator and motor are particularly well fitted for their work

Westinghouse Starting Lighting and Ignition Equipment is designed to meet the exacting requirements of each and every field to which it is applied and has proved its worth again and again So well has Westinghouse built, that its equipment year after year has stood up under the most severe operative con ditions

Fundamental soundness of product will be as vitally important in the days of readjustment as during the many months when the efforts of the Westing house Company as of many other manu facturers have been concentrated on the winning of the war when munitions and electrical power mechanicy have neces sarily come first and apparatus even of such essential character as automo mobile starting and lighting has had to take second place

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

General Solus Office, New York City 110-114 West 43rd Street Works, Newark N J

of work during the war, and it is to be
expected that the lessons learned will be
splined by them in the construction of artceast to be used during peace times as well.
Community Ritherdron states that the
companitive inservity of the German and
Austinian fixed practically reduced the
action of our asplanes to cooperation with
the Allied feets. Coast sixtonia were
cetablished in Italy, Prance, Great Britain,
back of operation from almore
Simon some of these bases were subject
to attack by cump planes, the Navy had

to attack by enemy planes, the Navy had to have also land machines for the protecto attack by can my planes, the Navy had to have also land reaches of rot the protoction of such is tablishments. In his paper (
Commander litherations gave a description of such is tablishments. In his paper (
Commander litherations gave a description of the control of the Four and the Dellaviland-Nine For training of pilots the Curtis N-9 was in training of pilots the Curtis N-9 was in favor, equipped with the Curtiss OXX 100 horse-power singin. This is a hiplane with a single center float and wing tip balancing floats. The Curtiss F boat also

balancing floats. The Curtiss F boat also was used for instruction. The Commander explained that while in general there was no great difference in the design of land machines and esaplanes, the weight of the latter was necessarily the weight of the lastic was necessarily greater and required a different landing gear and apparatus enabling the scaplane to leave the water and take to the air A number of charts were shown to illustrate the performance of varous planes taking into account the lifting capacity, speed through the air, resistance to penetration of air, and the power required for traveling at the performance of the penetration of air, and the power required for traveling at the penetration of the penetration of the uncertainty of the penetration of the penetration das usered. With a Laberty engine develop-ing 380 horse-power at 1,000 revolutions per minute, a speed of 80 miles per hour was attained attained

Considerable development work was done to determine the most advantageous form of float lests were made in the model basin at Washington, using models one-twelfth the normal size. When the tests were repeated with full-sized floats, the results were found to check accurately The Commander advocated the geared-

down propeller arranged to turn at 60 per cent of the speed of the engine. This would allow the use of a 11-foot diameter propeller instead of the 9-foot, and would raise its efficiency from 69 per cent to 73

The H S-1 is capable of carrying a load of 6,500 pounds at full speed The H-16 is a twin-engine seaplane It carries a pilot,

paper when corresponding about such a patents subscriptions, books, etc. pasents subscriptions, books, etc. This will greatly facilities carrecting your questions, as in many cases they have to be referred to expects the full man and address should be given in left with the full man. (14299) J. A. F. anks. About a year ago I in the strip is varied by the vibrations of the micro-phone transmitter. It would seem to be too deli-cate for rough use as a telephone. The instru-ment is described in the Scientific American Vol. 114, No. 4 dated July 24th, 1915.

(14300) G E O asks: Which has produced the higher degree of temperature, an abstract numeso or an onz-anotelyne blow torch! A The oxy-acetylene fiame is usually set at about 5 000 degrees Pahr, and the electric are at 6,500-7 000 degrees Pahr.

(14301) J D k. aska\* Is the decrease of resistance in a carbon sheath due to the fact that pressure causes better contacts between surfaces of carbon blocks, or is it shought to depend also upon some internal change? Roor spreat a variation of resistance can be produced. What other substances besides carbon are or can be used and in particular it there any substances. be used and in particular is there any substance which satisfies the safety whose used not in numerous hiocks but as one solid piece? Can you rake me to any discussion of these phenomena either in Neurarrays. Ausman as consisting of many thin plates act aimply by pressure, which brings more surface into contact and theorether reduces the surface into contact and therefore reduces the resistance There is no internal channe We do not know the rate of change with pressure to the contract of the contract of the face the size of plates and their routhness or smoothness would be involved in the determina-tion. We do not know that any other material is used in this way. Metak are too hard to yield to pressure, and non-conductors are out of the question. We do not know any articles on the subject.

(14302) G R T saks. We have been studying about the pressure of water, and are anisous to know the variance of pressures at mid-ocean that is, the difference in pressure from the top to the bottom. We are also wondering what became of the "Thatolo Is it probably intact in the spot to which it sush, or has it been musted ber cett
The HS-1 is capable of carrying a load of
6,500 pounds at full speed. The H-10 is a
twin-engine segulanc. It carries a pilot,
an observer and a "wireless operation" in the speed of the speed

## 74th ANNUAL REPORT W YORK LIFE INSURANCE COMPANY

346 Broadway

New York, N. Y.

## To the Policy-holders and the Public:

Any intelligent man knowing that he must immediately go to war would take any life insurance policy for almost any amount

offered by any responsible company at any reasonable pirice.

It gives us all something of a shock to realize that the deaths in our army during this unprecedented war just closing have recently

urpassed many times over by the epidemic deaths in everyday life
Influence we are told up to January 1 1919, had already kulled as many young and vigorous persons in the world generally as were

innuense we are cone up to samuary 1 1919, non stready kine as many young and vigorous persons in the world generally as were killed by bullets and disease in four and a half years of the war I

The wisdom of an adequate surplus in life insurance is now demonstrate! The folly of New York State in imposing a severe limitation on surplus—against which this Company especially protested in 1906 and since—is also demonstrated

Through a period of years the mortality of all soundly conducted companies in spite of influenza and other unforsen calculations,

will mall likelihood come well within the tables but we now understand that incidents can arise through which mortality may temporarily exceed the provisions of very conservative assumptions. It is comforting to know that neither war nor influenza can make any insterial difference to you as a member of this Company, because as against such starting incidents this Company long since made abundant provision

From this there are two fair deductions

First-INSURE-there are just as many and just as sound reasons for insuring your life during days of peace as there are for mauring during times of war.

Second—insure in companies that have aimed above all things to achieve safety. In these days SAFETY sounds better than CHEAPNESS.

Our mortality up to the outbreak of influenza promised to be in 1918 about 61% of the mortality provided for in the premiums it was actually 95% of the expected. If this epidemic persists during 1919 your so-called dividends may be reduced in 1920—they remain substantially unchanged in 1919

New Business of the year chiefly from the United States and Canada \$340 000 000 The largest new business in the Company a history Received in life insurance premiums 110 000 000 Paid policy-holders Death claims \$35 000 000 To living policy-holders 62 000 000 97 000 000 We bought so many Liberty Bonds during the year that we were obliged to borrow from the New York banks Our statement shows, on that account Bills Payable 22 800 000 70 000 000 30 000 000

December 31, 1918 we owned at par Liberty Bonds aggregating Bonds of the Allied countries, issued since the war began Total war bonds owned

The Balance Sheet follows

## COLONEL ROOSEVELT'S LAST **EDITORIAL**

On which he corrected proofs Saturday, January 4th, will be published in the March issue of the Metropolitan Magazine. It is his last message to his countrymen and breathes the stalwart Americanism of the great leader.

The March Metropolitan will be a notable magazine for the Colonel's many admirers. In addition to containing his last editorial a large page size portrait of Colonel Roosevelt, the one he liked best, in rotarygravure, ready for framing, will be included. Another feature also handsomely reproduced in gravure will be the Colonel's famous Metropolitan editorial "The Great Adventure." which has taken its place in American literature with Lincoln's Gettysburg speech. The Editor of the Metropolitan contributes an interesting and intimate appreciation of the great part the Colonel took in crystallizing America's fighting spirit in the last history making years of his life.

# THE OLDEST BUSINESS in America now chooses FEDERAL Trucks

The Hudson's Bay Company has had more than two hundred years of active experience in transportation.

Its judgment of modern motor transports amounts to moral certainty.

Its deliberate selection of Federal Trucks confirms a fact that thousands of other discerning business institutions have recognized.

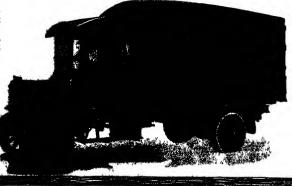

Federal Trucks of proved serviceability, fulfill every requirement of modern motor haulage

'Federal Traffic News"— a publication on modern motor haulage and its application to business will be sent free on request to responsible executives

## WHAT MAKES *VALUE* in A MOTOR TRUCK

A TRUCK yields so much performance for so much money—price plus operating cost. What it can do, how long it can do it, how dependably, at what cost, alone determine its value, into which enter five factors to be carefully considered by every purchaser. These are:

#### Record and Performance

WHAT a truck can do is measured by what it has done, in work accomplished and length of survice Where comparative cost records are properly kept, single unit White instillations grow into fleets In mixed fleets, White equipment is uniformly selected for the hardest task.

#### The Maker

VFRY truck needs a sponsor, a maker E whose name is a guarantee of honest, efficient manufacture whose policies and resources assure that he will be here to stand back of his product permanently The importance of this is apparent when you consider how few makers survive in any line of manufacture

The White Company is financially sound It has been building highest quality motor vehicles for eighteen years, and holds a manufacturing position second to none.

#### The Factory

THF White factory is one of the largest equipped that a very large volume of out- expertly installed and permanently proput is obtained per unit of labor. Thus the \_tected.

purchaser receives value fully commensurate with his investment

#### Truck Experience

THE White Company sells not merely 1 trucks It sells efficient transportation It knows how to install the kind and size of equipment for a given task can adjust the truck installation to keep step with the business It has knowledge gained by years of experience with many thousands of trucks in all lines of trade-an asset of the greatest importance to the purchaser.

#### Service Facilities

TO get maximum earnings out of a truck. I it must be kept going, and this can be assured only by resourceful and convenient service to the owner

The White Company has covered the country with facilities for quick and complete service-plants, spare parts and field organization It required years to build up No new manufacturer can do this; no small manufacturer can afford it.

The purchaser of White Trucks secures I in the industry and is so modernly motor transportation at the lowest cost,

THE WHITE COMPANY. CLEVELAND

THE IONG-BELL LUMBER COMPANY has a well established reputation for the uniform high quality of its lumber products. As evidence of that fact, in the short time of twenty-five years the number of our saw mills has increased from one to thirteen and we have become the largest manufacturers of Southern Pine in the United States. Vast virgin forests, complete, modern mills, milling methods which are unsurpussed and the infinite care given to every detail of our business make this trade mark—

## Iong-Rell

THE MARK ON QUALITY LUMBER

That mark is now branded on our lumber products it identifies quality

IONG-REIL Air Seasoned, Creosored long leaf South ern Pine Poles one of our well known products are decay proof. They will give satisfactory service for upwards of 50 years for the IONG-REIL hydraulic pressure-vacuum process of creosoting thoroughly impregnates the entire sap w od **ipne-Rell** Creosoted Southern Pine Poles possess great strength resist ordinary crass and brush fires and are straight and attractive They are branded on one end with the I B mark

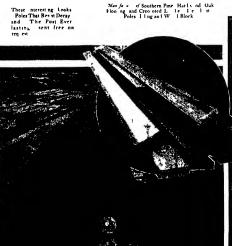

Officials responsible for continuous efficiency will find that **Ione Bell**. Cre soted Poles assure good service in I will prove the assund investment

Γο be su e of quality ask your dealer for lumber products bearing the **long-Rett** trade mark

## PACKARD PRICE INSURANCE

In fairness and justice to all purchasers of Packard transportation units, whether Packard Trucks or the famous Twin Six Passenger Cars, we wish to make plain our position regarding prices for the coming year

HE Packard policy is nothing short of absolute insurance of your investment at present price quotations

If at any period during 1919, by reason of lower costs of material and labor or for any other reason this Company finds it possible to make a price reduction, this reduction will not only be made but made retroactive and we will refund to every previous 1919 purchaser the full amount of the difference between the price he paid and the new

If, on the other hand, production costs should increase and a higher price become necessary, the present purchaser has the advantage of his investment as the new price will apply only to those whose orders are received after the change is announced.

As we stated some weeks ago, Packard prices are carefully and accurately based on the cost of material and labor There was no artificial inflation during the war and costs have not decreased since we last manufactured for private consumption, consequently there is no leeway for a price reduction now

If a reduction becomes possible, every present buyer sees his investment protected and insured.

This policy, while unique in the automobile world today, is consistent with Packard policy in the past, and seems to us the most fair and straightforward way of meeting present conditions.

Were we to give a guarantee that present prices would be maintained, it would mean a one-sided bargain in favor of the manufacturer, as it would prevent us giving the buyer a reduction, should material and labor costs justify a reduction.

The Packard Company makes a greater percentage of all the parts that enter into its car than is made by any other fine automobile concern in America. It does this because it cannot buy and assemble parts that are up to the Packard standard of service and quality.

Skilled labor of necessity enters very largely into the production of so beautiful, so simple and so proficient a mechanism.

The net result is that the upkeep of a Packard Twin Six is less than that of compromise cars at half or two-thirds the Packard price.

To the man who can afford the first cost, a Packard delivers utility value for every dollar of his investment, greater economy, less depreciation and it does not ask him or his family to compromise in the service, the comfort, the safety of their motoring.

From present indications there will not be enough of either Packard cars or trucks to meet the demand this year.

Trucks are ready for immediate delivery. Your order for a Packard Twin Six passenger car of say model should be registered with your Packard dealer at once to insure late spring delivery.

"Ask the Man Who Owns One"

#### Derelict Mines A Peace Peril

N1 of the regulations of the Hague Convention directs that all innes and tornedoes shall be so adjusted that they can never become a per manent menace to navigation. Torpedoes must carry an automatic device of such a character that if th torpedo misses the mark the firing mechanism will become inoperative and mines must be so constructed that if they break loose from their moorings and float to the surface their firing incchamsm will cease to oper These obligations form part of a series of rules and regulations which are designed to protect non combatant ships both during war time and in the neace that follows a war. Phone is abundant evidence that the enemy failed to live up to these humane stipulations -a fact which is continually being brought to public attention by the loss of merchant ships through contact with mines in almost every quarter of the navigable sear

One of the strpulations of the armistics called for the ill disclosure by Germany of the plans charts etc showing the location and extent of the areas which she had mined during the war and in the intervening months since the armistice allied mine swepers have been engaged in removing those obstructions. In view off the disorganization of their navy during the latter part of the war: it is doubtful if the German Admiralty accurately charted this mined arise and this mines be particularly time of the work done by the German submarine men-planters which probably bad a roving commission to drop their eggs wherever the individual commander had opnortunity for undisturbed operation.

But even if the German admiralty has accurate charts of its own mine fields the complete removal of these would not mean that the seas have been rid of this deadly peril Swift currents and heavy seas frequently cause the mines to break adrift from their moorings and when this hannens out him to her omes a floating menage which is more deadly to payingtion than any water logged lumber schooner or other derelict of the sea. The alhed navies followed strictly the rules of the Hague Convention and when allied mines broke adrift or torpedoes went astray they became or were designed to become The ruthless methods of sea warfare fol apop jonal lowed by the enemy included a total neglect of this precaution with the result that heaven alone knows how many mines are floating on the surface of the sea that require only a touch from a passing ship to detonate them

I or these reasons we think that for some time to come shipping should continue to use the profestive measures which proved so effective during the war particularly when they are passing through waters such as those lying off our own coast and those of I urope where the enemy mine-layers were most active during the war. Many merchant skippers are alive to the danger and are acting the captain of a freight ship informs us accordingly that, once clear of the harbor entrance of an American port, he throws overboard his paravanes and does not take them in until he is well out to sea and that, on approaching his Luropean port of destination he makes a nort of dropping them over loard sesso. How long the peril will continue cannot even be conjectured but it will be remembered that over a year after the close of the Russo-Japanese war, a merchant ship was sunk in the eastern waters of the Paonic by a mine which had broken adrift during or subsequently to the naval oper ations of the war. For a long time to come it will be the duty of the watch to keep a sharp lookout for this deadly north of the sea.

#### The Hudson River Tunnel

It is doubtful if there is a problem of transportation anywhere in the Unsted Stat a which calls for a speedy solution no loudly as that which concerns the city and port of New York. To say that present facilities both for passongers and freight are inadequate to to state a fact which is perfectly well-known to every New Yorker from railway president down to the humblest strap-hanger

It is as true as it is paradoxical that the very topographical features which make New York one of the finest ports in the world, at the same time reader it one of the most difficult to operate for although the Hudson River is a magniteent fairway for shipping its breadth of 3 000 feet has proved a sectious obstack to the working out of a well coordinated and co-minuted system for the distribution of passengers and frught and particularly of the latter.

Not only as Manhattan the very heart of financial, commercial theater-going and pitasure-seeking New York but the indications are that it will ever remain such and the problem of the distribution of freight and passenger traffic will always dy 1s1 upon the question of overcoming the great natural obstacle which separates Manhattan from the mainland

Twenty to twenty-five years ag, it was believed that the solution lay in the construction of one or more bridges across the great river but just on the eve of the active construction of a bridge the divelopment of iterror traction reached a stage which made it possible to operate passenger trains beneath the Hudson River without fear of killing off the traviters with that most deadly posson earbon monoxide gas. Thereupon we saw the construction of the two Praneylvans tubes and the four tubes of the Hudson tunad system all electric ally operated.

But let it be carefully moted that the eigenering world refused to commit itself to the construction of these tubes until the electric lecomotive was forthcoming for it was well understood that any system of traction which involved the combustion of fuel and the expulsion into the tunnel of the poisonous products of combustion was ruled out of the case on the ground of human health and safety. It is needless to say that electric tries too through those tunnels has been a great success and that there has been no difficulty in maintaining the purity of the air

It is now proposed to build a great double-deck tunnel beneath the Hudson and use it for motor truck and automobile traffic This would be an altogether commendable enterprise if its promoters were possessed of reliable data based on actual working conditions which showed that it was possible to allow a closely spaced stream of automobile and motor truck traffic to proceed continuously through a tunnel several thousand feet in but no such data exist | I he danger of asphyxia tion of passengers, truck drivers chauffeurs etc, arises from the fact that perfect combustion can never be obtained in the cylinders of a motor and that there is consequently a certain percentage of that deadly poison, on monoxide, exhausted into the air \_hxperiments made by Clerk showed that this poison is present in a ratio ranging from 2 4 to 6 9 per cent of the total volume of the exhaust of a motor ear, and the Royal Automobile Club in a test of 12 cars, obtained four results below two per cent and eight above that figure, while other observers report as high as 15 per cent of carbon monoxide

The peri of this possess here in the fact that it is colories and codretes and stateletes, and that except by chemical analysis, its presence than be detected only by the symptoms of possessioning in the pattern. The sponsors of the tunnel believe that fit can be properly ventilated by artificial means, but one of our most expert authorities on visitation has estimated that to ventilate the 5,500 feet of tunnel between the man shafts would call for a 12 000 horse-power plant—that is to say to keep the procuratego of earbon monoused down to the point of safety would require such a rapid continuous replacement of the air, that a ventilating system of that great horse-power would be necessary to do this work with a proper factor of safety.

Therefore, we urgs upon the authorites the nessessity of making, in the interests of public safety, a most thorough examination of this question of ventilation before the necessary sanotions for operation are given. The tunnel should be built, but with the understanding that it shall be used only for electric and horse-drain traffic, for such in the growth of Greater New York and Jersey Chty that any and every means of rail and vehicular transportation between Manhattan Izland and the manland will be used to its full capacity, almost from the very day on which it is put in service

#### The Doubtful Factors in the Problem of Transatiantic Flight

HAT a flight across the Atlantic Ocean will be made in the immediate future as almost certain. It is, in fact, altogether remarkable that solisted before now I'll to one that solisted before now I'll to other histories and the solisted before histories and the solisted before histories are solisted before the Atlantic S. however, quite another matter. It would be unsafe to predict how soon, and under what conditions, this will be realised.

The monumental report of the Civil Aerial Transport Committee, recently published in England, embodies some discordant ideas on this interesting question Few persons have given more study to the problem of transatlantic flight than Commander Porte, whose preparations to undertake such a journey in the summe of 1914 were terminated by the outbreak of the war This authority, as quoted in the report just mentioned, believes that the direct route botween Ireland and Newfoundland is at present out of the question, and that for many years to come the only practicable route will be by way of the Asores Commander Porte also considers Newfoundland an unfavorable terminus for the westward journey on account of the obstacle opposed to a safe landing by the notorious fogs of that region He prefers a landing ground on Long Island, though its distance from San Miguel (Asores) is about 2,250 nautical miles, as compared with 1,346 miles from San Miguel to Newfoundland

The elements of uncertainty in transatiantic flying are almost wholly meteorological. The proposed Asores route offers the advantage of the trade winds for the westward journey. Whether and to what extent, the counter-trades which blow above the trades and in the opposite direction could be utilized for the return journey to burrope is still doubtiful, because we lack precase information about these winds, particularly as the hiele of the whole of the precase information about these winds, particularly as the hiele of t

That the coasts of Newfoundland are habitually shroaded in fog seems to be taken for granted in all speculations about Atlante flight. The Britain report, however, roatsins two communications from authoritative sources which emphatically descredit this idea for the Newfoundland coast for years, declare that long prevails there only with winds from a quarter between north there only with winds from a quarter between north was an experiment of the prevailing winds are from west and northwest. He has given a whole season from west and northwest. He has given a whole season from west and northwest. He has given a whole season from the 
The moral of all this seems to be that a metocological and strological arrey of the North Atlantic Osans and the adjacent ceasts should be undernaken as soon as possible, with special reference to the needs of seronautics. That ar lance scengeritis Atlantic are destronable to become of great concount injunctages heardy admits of sjouth. The study of surface "injungation and adjacent and the second 
#### Blactricity

Autometic Fire Extinguishers for Transformers. -In conjunction with the Salakotten Works for explosion-proof containers, the firm of Stemens & Halake of Germany has developed an automatic fire-extinguishing equipment for use with trasformer or oil-switch ars A thermally sensitive device in the chamber to be protested closes a relay circuit when the temperature in the chamber exceeds a predetermined limit The effect of this is that a tank of sulfuric acid is emptied into a potamum carbonate solution and the CO- formed is carried by a pipe line to the chamber where fire has The chamber is filled quickly with the gas and the fire is stifled At the same time one or more alarm bells are rung, the ventilating chimhey in the roof and the oil outlet in the floor of the chamber are closed, and valves in the CO<sub>2</sub> pipes leading to the chamber affected are opened Description of an actual metaliation is given with dimensions of the apparatus in a recent useue of Science Abstracts

Underground Wireless - Speaking recently of his work for the Navy, Prof James R Rogers the inventor of a wireless system for underground and submarine transmission, stated "Six or seven years ago I began experiments with the transmission of electric impulses by the ground They were renewed during the war with the audion bulb which renders the receiving apparatus more sensitive I first established contact with nearby points and before long received with perfect distinctness impulses sent from Europe I placed my antennae in trenches radiating from a center and pointing by the compass toward the distant station from which I wished to receive I demonstrated to the Navy Department that eight operators may receive at once from eight separate wires My system was installed at New Orleans the Great Lakes station and Belmar N Y and is now used at the principal wireless stations in the United States I have found the best results with my wires buried six feet below the surface in damp ground Some of my experiments were conducted in water 25 to 50 feet deep

Radio Telegraphy in the British Air Service .-The new air service for passengers mails and parcels delivery will begin, it is stated in the United Lingdom and the continent of Europe Every airplane will be upplied with a combined wireless and telegraph installation and an efficient operator adopting the same system as is in force with regard to ships. As every airplane will doubtless have either a name or a distinguishing number it will be possible to send telegrams from any part of the world, or from any ship on the sea to the airplane It is intended continues The Florirician that this organisation will be ready by the time peace is aigned and the relaxation of restrictions will allow the free flight of airplanes. Arrangements have recently been made for the erection of wireless stations in the extreme parts of China one on the frontiers of Cashmere and the other on the Chinese side of Siberia For this purpose machinery will have to be conveyed right across China and transport by air will have to be arranged for there is neither railway nor road The Marconi Company has arranged with Mr Handley Page for the transport by one or more of his big machines

A Standard in Radiotherapeutics - The problem of a suitable standard of quantity for use in radiotherapeutios has received much attention and cannot be said to have been completely solved. Most of the devices have been based on the application, as the units of a certain fraction of the energy required to produce inflammation or redness of the skin but this is naturally s somewhat indefinite measure as is shown by the fact that the ratio most commonly employed originally one-third, is now taken as one-fifth Mr Bordier in a cent communication to the Académie des Sciences proposes as an alternative a method depending on changes dissociation, and has devised a chromoradiometer,' providing five chief scales (based on colorataon) which will suffice for all clinical cases, according to The unit is defined as the quantity The Electroson of X-rays espable of liberating 0.1 milligramme of iodina in a sable centimater of a two per cent chloro-formic solution of sodoform of a thickness of 1 cm, and placed in the shadow of the radiation. This unit, it is contended, depends on precise physical processes, which is not the case in the methods previously man-

#### Science

Stenches as Danger Signals in Mines —The U S Bureau of Mines announces that it has developed a novel method for giving a danger warning in mines particularly metal mines, in which compressed air is used throughout the workings An Ill smelling substance is injected into the compressed air line and within a few minutes the odor is apread throughout the subject. A technical paper is to be published on this subject

The Mineral Resources of Spitsbergen —A cording to a note in Nature, the accessible coalfield of Spitsbergen are estimated to have a content of at least 4000,000 000 tons of good steam coal and this region is destined to become one of the thir coal-producing countries of Europe About 100 000 tons of coal were shipped from Spitsbergen to Vaudindavana countries last year. Promising samples of iron ore have been received from this archipedage, other inneral resources of which include gypsium in enormous quantities abbestos copper ore, all shale and probabily free oil.

Fighting Mosquitoes with Bats in the Philippines—The Idea of fighting mosquitoes and incidentally providing a source of guano by the erection of bat roots figured videly is the press are may or seven years ago in connection with an undertaking of this sort in Texas I is indervating to learn that this idea has now been taken up in the Philippines where the Bureau of Senece is encouraging the building of hai roots as an aid to the destruction of morquitoes. The Bureau has drawn up plans and spot instations for this dotted which it distributes to any one who will erect a

A sumptuous Work on Phesants is William Beebes Monograph of the Phesants in flour volumes the first of which has recently been judished in I indiand under the auspices of the New Yir k', logical Society In order to collect material fir this work the author with the aid of funds supplied by 'ol A R Kuner of Barnardwille N J spent I' monograp had in constitute Ama and the East Indies and also vest( I a number of museums in Lurope The monograph will constitute by far the most important so are of information on the subject with which it deals I it is cyrously and beautifully illustrated but—a four volume is antific work that sells for \$250 a na anomaly that ought to be corrected!

The Study of Industrial Fatigue as carned on in British munition factores during the war led to results of great interest to both employees and employees. We are glad to bearen that the British are; in we gue to extend these investigations to industrial cut il inhimonts generally and have accordingly setablished in Industrial Research Board uni'r the Dipartment of Scientific and Industrial Research Committee. The duti's of the heard as reported in Naires, will be it ministe organize and promote, by research, grants or offer yes investigations in different industries with the vice is finding the most favorable hours of labors, spelle if work rest juames etc. The chairman of the board is 1'rd (8 Sterrington and headquarters have been catablished at 15 Great George 81, Westmuster, S. W. 1 I ondon

New Experiment Stations of the Bureau of Mines Of three experiment stations lately established by the U S Bureau of Mines, one has been located at Bartlescilla. Okla and will devote its attenti p to the petrol um industry. The town of Bartlewille through its chan ber of commerce, donated the site and provided \$50 '00 for the erection of buildings and it is expected that he state of Oklahoma will provide funds for corperat re investigations A second station which will be devo d to studies relating to caranics has been locate, at Columbus, Ohio which is the center of important slay industries The University of Olio provided quarters and is furnishing half the necessary funds for the support of the station. The third new station situated at Minnespolis, will investigate problems relating to the iron and steel industry. The first year has been devoted to the question of increasing the supply of manganese available for making steel, in view of the scrious shortage of this substance Eventually the Minneapolis station will take up the important question of beneficiating the low-grade iron ores upon which the iron industry will be obliged to depend when the rich ores now available in the Lake Superior ragion and elsewhere are exhausted.

#### Astronomy

More Nova In the Andromeda Nebula—Two more now were found in the Andromeda nebula on a photographic plates taken last October with the 80-inch reflector of the Mount Wilson observatory making as total of 11 thus far discovered within the limits of the nebula. Neather of these two any pears on plates taken in August which probably res it is stars of the 18th photographic magnitude.

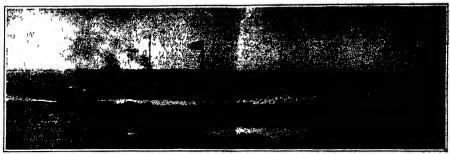

A New Observatory in Arizona —In consequence of a gift of 860 000 from the latt Mrs H S Steward of Tueson as a memoral to he rivalend a new astronomical observatory is about to be creeted on the campus of the University of Arizona at 1 tueson The principal felescope a 37-inch reflector was ordered some time ago, but work on it has been delayed by the war. The observatory will be under the direction of Prof A E Dourlass

Interstellar Media and the Colors of Stars—Mr. Harlow Shapley in his recent studies on the tolors and magnitudes in stellar clusters states that the similarity in the frequency of colors for near and distanct clusters shows that the selective scattering of light in space if string uniformly affects the color induces of stars by less than two-millionths of a magnitude for each parses of distance. With any reasonable assumption as to the dependence of light scattering on stellar concentration, interstellar media appear unimportant in their effect on the colors of stars brighter than the fifteenth magnitude of the start of t

Size of Planetary Nebulse Measurements of the parallaxes of nebulæ are beset by obvious difficulties and comparatively few satisfactory measurements have The most recent investigation in this field been made that of Adriaan van Maanen of the Mount Wilson observatory who has measured the parallaxes of six planetary nebula with the 60-inch reflector of that observatory I rom the parallaxes it is possible to de duce the size of these objects | the largest of those measured (N G ( 6720) has a diameter of 10 000 astronomical units the smallest (N & C 7662) a diameter of 1 350 astronomical units (major axes in both cases) The diameter of the orbit of Neptune - : the diameter of our known solar system-is only 60 astronomical units

Meteorology of the Solar Eclipse of June 8th, 1918—An analysu by Meser kunisal and larguason of the data obtained at 55 Westher Burran stations lying within the rose of 90 per text obscirration of the sun during last nummer a total eclipse, shows that in general the fall of temperature was compartively small owing parhaps to the cloudy settle that prevailed along the path of the cloudy settle that prevailed along the path of textle years of the cloudy settle prevailed and the path of textle years of the path of t

The Problem of Solar Rotation is reviewed in a recent paper by ( St John in which he assembles the large body of data thus far obtained by means of spectroscopic measurements as to the linear velo ity of solar rotation at the equator The data obtained by several observers extend over a period of 21 years and the values range from 1 86 to 2 08 kilometers per second Measurements of the speed of the sun s rotation are complicated by the fact that the sun is not a solid body and its rotation varies with latitude also as shown by studies at Mt Wilson with altitude to different rates of rotation are found at different levels in the solar atmosphere I saily local convectional currents in the sun a atmosphere though they may have little effect on average values make it lifticult to discover possible short period variations in the speed of rotation. Hu brecht has found evidence that there is a difference in rotation between the northern and southern hemis-It is very dourable to have an extended series of determinations made by the same observer and at the same time to keep the instrumental conditions unchanged Such a program has been under way at Mt Wilson for five years and it is hoped to continue it through a whole sunspot evele

New type of submarine 340 feet in length doing 24 knots under steam Note the three 4-inch gana, two forward and one aft; also the two amekestacks, which feld down when the submarine submerges. Displacement submerged 3,700 tons, agond 10 knots

## The Submarine Situation

The Submarine with 12-inch Gun a Fact-and Some Other Facts By C. H. Claudy, Special Correspondent of the SCIENTIFIC AMERICAN in London

PRYING submarine facts out of the British Ad-DIVING submanns facts out of the British Administry is something like prying an argument in favor of naval drinking out of frend Damele—it can be done to the thought of the done the diving out of frend Damele—it can be done to the thought of the daministry people, but they first find out if you play risk it (Laglash for being on the level 1) and then they bind you to secrecy. You must it tell 1 ho chainstay doesn't want submarines to much talked about And if you sak them why you get something like this 1 he peace conference has just being in Young how the tit will be deceded that thereafter there are to be no such things as submarines. It is possible that it will be deceded that thereafter there are to be no such things as submarines. If it is deceded that the ubmarine has too many indecent possibilities—as was decided long ago in the case of poissoning will and the use of poissoned bullets or mushroom bullets—then there would be no objection to telling very one everything we know about submarines. But if sub-verything we know about submarines Is aft justice. everything we know about submarines But if marines are to continue to be a naval weapon we don t want to give away all the things we have learned And

want to gave away all the things we have learned. And formany has by no means any monopoly on submarine formany has by no means any monopoly on submarine After you hear anything like that, of course, you just larly inth to take some of these submarine people and shake them by the besis in the hope that some sub-marine facts will drop out. Indeed, a few have dropped out my way which I can ropest but I have the feeling that there is a for more behind which they won it till

For instance the use the British navy made of submarines during the war. They haven't said much about it but the British submarine seems to have played a rather large part in anti-German-sub work. It so a rather large part in anti-German-sub work. It seems that it was a very large factor in convoy work and that one of the reasons why we managed to land a couple of million men in France was because Britash subs were constantly on the job. A collection of them—number would be deleted by the censor if I knew it and put is m-would need all the convoys as they approached the German submarine sone and accompany the troop ships and destroyers in This fast was carefully allowed to come to German's notice. The result was that German submarines immediately became very

much more cautious than they wanted to be A German submarno could lie on the surface waiting for the approach of a convoy known to be due and sight it, from its low position in the water, long before it could be sighted. It would then be comparatively easy to submerge keep the convoy in range and choose ship and time for a torped shot But if the German automarna. time for a torpedo shot. But if the (serman submariae commander felt that every natant he was on the surface he was under possible observation from a Britain submarine persone and that he, in turn might memericanly oxpect a torpedo to arrive and make torpedom that oxpect a torpedo to arrive and make torpedom that oxpect is torpedo and the submariae torpedom the submariae torpedom the submariae torpedom the submariae to the subm through periscopes

through peracopes
A peracope sounds very nautreal and optical and
devilish. Actually it is a way medicent substitute for
clear vanos. And while the immunity of conveys
of troughtips coming from Americe may be necessarily
of troughtips coming from Americe may be necessarily
samoles screens airchips, careful plans, what you will,
there is a kine any sum to on the face of the British submarine authority which says that in his belief at least,
the strong moral effect of the presence of British submarines secompanying all convoys in, had a lot if not
most to do with it! most to do with it!

British submarines were largely used in patrol work in the North Sea where also their moral effect was felt Doubtless they laid mines and doubtless, too, they made German mine-laying submarines have a more difficult time than would otherwise be the case. Laying a mine van a submarine sounds very easy but as a matter of fact it isn t. A mine-laying submarine—there is a German mine-laying submarine now lying as an object of ex-hibition off Westminster Bridge—has a series of wells forward which hold there nuises each. The mines are released by pulling a lever inside, one lever for each are released by pulling a sever inside, one sever for each mine. The mines are prevaranced with anchors and cables of the proper length and they must be laid, therefore all in a certain prearranged and specified place, otherwise they will be too deep for effect or so close to the surface that they may be seen. To find a specified area from the deek of a ship, in fine weather, and with no onemy about, is one thing To find the same area by dead reckoning, in bed weather, from a submarines, which is dodging belloons, airplanes, destroyers and other submarines, is something else sgain! And there appears small doubt that Fritz had it by no means all his own way even with his very efficient exploit-year-laying small doubt that Fritz had it by no means all his own way even with his very efficient explosive-seg-laying undersea boat It is reported, for instance, that over 12,000 Bruta muses were ladd from March to November by one fittills in one locality (Helupoland Bight) and while by no means the work only of submarines, sub-marines were an indisponsible part of the work. Bir Ero Geddee has said that "as the German sary would not Ero Gedoce has said that," as the Uerman navy would not come out in force, our submanue and mine-lying bosts, had, day after day and night after night, entered huge German mine fields of Heligicand and blocked the channels through which some German boats left and returned These trap mines dat to over one hundred German eraft being eaught during the first six months of 1010 "

1918" There seems to be a general impression abroad in the world that Germany had almost a monopoly on such marine devange, and that the rest of the world stood by in annearment of humbly followed in the master's footness, and the provided with the matter's footness of the world stood to the matter's footness of the world of the matter's footness of the world of the matter of the world of the world of the world of the matter of the information that the of them at least volunteered the information that the plans for many a German submarine had been seen and examined before ever there was one captured of the same type—which would seem to induste, if truth that Germany had no monopoly of secret service effic-

iency! However that may be, it is certain that while sub-marines do not carry paravance for avoiding mines in fields.—for the paravance is too slaborated and com-plicated a device for a submarine, the efficiency of which consists largely in its ability to rise, "look—see" and dive-

A real super-submarine, mounting a 12-inch, 50-ton gen, and built for bombarding the forts at the Barchardine Streits. The British and this weeks is included by

pile, an afficiency which would be largely interfered file by any such additions to its bow-while they de not carry paravanes they do have some method of avoiding mines I wish I could tell you what it is swelding mines I wish try out and your what it is, to the hear all sorts of runner. One hear of a wonderful shedried device which "unliftes" the potency of mone prought within range of the "unliftying" ware. One sake the Admirally authorities about it, and they doubt one's sanity—and small blane! But some sort of a mine avoiding ability British submarines must possess the submarines which were the work they undoubtedly did do in locating the outrance and the suit to the mine protected areas from which German submarines were wont to come and go.

Bagiand started with some 86 authorized, built about its good to be a submarine with the submarines were wont to come and go.

Bagiand started with some 86 authorized, built about its good to be a submarine such as the submarine see that the submarine see that the submarine see she never had known before O course she explured some German of the money that the output of the submount before O course she explured some German of the submount before O course she explured some German of the submount before O course she explured some German of the submount before O course she explured some German of the submount before O course she explured some German of the submount before O course she explured some German of the submount before the submount before O course she explured some German of the submount before O course she explured some German of the submount before the su

the learned how to build submarines as has never hed known before Of course she captured some German submarines as has never hed known before Of course she captured some German unbursaines and doubtless took some ideas from her senemy, but she developed some ideas of her own which has a 1700-ton submarines carrying a 12-lach gun. No build to the Dandandeleo operations and while he was completed too late for that purpose she was a technical success. Ble fives, of course, only force and aft, the gun having a traverse of perhaps six degrees and only an accessed be fives, of course, only force and aft, the gun having a traverse of perhaps six degrees and only an accessed be 6500-pound shell a maximum of 15,000 pressors. The first course is course of the second of the course of th

brazzions and copperiess all her valve wheels a

metal or from.

Another fact which stoke out like a sore thumb is that she was evidently built to be lost, not to last. There has been no such thing as accessibility connidered in her fittings. For notance, the ventilating fanche capitals called my attention to its hum, and said that, of course, they could stop and start it. But they couldn't booke it statedly and that if it broke down and had to be regarded it would apparently be a dry-dock to the capital of the start of the capital of the capit had to be repaired it would apparently be a dry-dock job. Nothing in her has been planned with the idea of job. Nothing in her has been planned with the idea of the planned with the helicity of the planned with together with the helicity of the planned of destroyed together with the helicity of the planned of the an overhaul she would be captured or destroyed Her engines, two six-oylunder 300-horse-power at 500 revolutions per minute heavy oil engines, were, according to the young British commander, models of their kind, sweet-running and efficient Her two

me, one used from the conning tower and one from the control station just aft the mine laying com-partment, are beautiful examples of Carl Zeus, Jena optical work But they possess no focusing device for eye-accommodation which would make them most inde-

eently difficult to use if strictly normal She car-five officers—and she had for eight of the crew and place to eat, save the rest, save the bunks, no bunks! Room simply bunks 1 Room simply
—indeed, the pussle is
placed themselves Of
crowding is due to pracforward of the conning mine wells, storage

ones eyes were not ried a crew of 40 and siceping accommodations two officers! There is no two officers! I nere bunks, no place to place to hve, saye the doesn t exast on her where the 40 men course much of the tically all the space tower being devoted room and galley but

Bow view giving end-on view of 12-inch gun, which has 6 degrees traverse

even with all that room available for living quarters the U C 95 is a mighty crowded vessell

It was interesting to learn that mon small physically re preferred in submarine work, not so much because by take up less room than larger men but because of the fact that a submarine sailor or officer must wear a great may olothes to keep werm and a big man can't put on enough and still have room to pack swiftly through the hatches! The tempersaires of a submarine in winter it seems, rarely rises above \$0. If the capitae are running the hatches must be open to supply air and the amount used is enough to make a veritable cyclone come down the hatches are Result, insterior temperature is always low If submerged, and no air moving through the book, the temperature is kept low by the temperature of the water outside and the fact that the enginee a source of heat, are not running! Consequently every one piles on sweaters and leather costs and workin underwear and the fact that a submarine sailor or officer must wear a

fur gloves until the diameter of the hatchway limits further protection!

There is a wide divergence of opinion to be heard regarding the disposition of the surrendered submarine Admiralty officers not connected with the submarine service generally think the submarine should be abolished and the surrendered boats sunk or distributed to various nations simply as exhibits and currosities of course they will tell you  $\sigma r f$  flows can play the game and dd play it—uc to principle and ended in oper boats with defence-merchantmen and shelled no oper boats with defencemerchantmen and shelled 110 opt: boats with delicace-less women and children nor stood by and In ighed while enemy crews drowned! But other people apparently, can't And if they can't then the submarine ought to be abolished and all those in curtence sunk

os sonismer and all toose in extreme sunk.

This point of view natural amough in a nation which hates Germany under the sea as she never will hate her on land, wont hold water with a parallel argument. No naval authority wants to abolish seaplanes yet air planes were used to homb hospitals and murder defence less women and children in church home and school of the property of the planes women and children in church home and school of the planes women and children in church home and school or the planes women and children in church home and school or the planes women and children in church home and school or the planes women and children in church home and school or the planes women and children in church home and school or the planes. The submanne-service man, of course, points to the work his branch has done during the war and his absolutely clean record, and asks why a perfectly good weapon must be abolished from the world's navies because a blackguard, a man who doesn't play cricket a beast with no understanding of the dictates of humanity in warfare happened to misuse that same weapon? se knows what the Peace Conference may decide and it may very well avoid a possible source of discord by agreeing to destroy all the captured submarines rather than try to distribute them—but it seems a frightful waste of good material

#### Electric Welding in British Ship Construction

ALARGE British electric company has issued a pamblet on the application of its system of electric welding to ship construction. This is the system that was employed in the first revetless ship the launching of which was snounced in July last and it has also been approved by Lloyd s for use instead of riveting in vessels intended for classification in their Register Book

For the last two years the company has been investigat-

ing the problem involved from two aspects—on the one hand testing the relative strength of welding in various types of joints and under all conditions of stress, and the other determining the modifications of d necessary or desirable with welding Some of the results obtained under both these heads are given in the pamphlit and are held to show that a suitably designed joint welded by this process, is not merely as strong as a riveted joint, but is in fact substantially stronger and that the various modifications in design evolved by the company overcome many difficulties encountered in the

tompany overcome many entrements a usual methods of ship construction

It is pointed out that a mere tensile or bending test is not a sufficient criterion of the strength and suitability of a welded joint and two joints welded by different processes may give approximately equal tensile results, but show a marked difference when subjected to alternating stresses. Thus on tensile test there may be little to ing sursees. Intus on tensite test three may be intule to choose between two joints, one made by a skilful widder using a bare wire or ordinary slag-covered electrode and the other by means of are electrodes but on an alternating torsion test the latter, it is stated may be expected to stand at least 200,000 alternations while the former will usually full at less than half that number

## Influenza—The Sphinx of Diseases

By Wade W. Oliver, M.D., Professor of Bacteriology, The Long Island College Hospital, Brooklyn

WHEN we speak of the cause of a disease we are WIEDA we spork of the cause of a miscose we are guity of an error. Any given disease has many causes for purposes of convenience and exacting the causes of a disease in divided into two classes (1) the exciting cause and (2 contributing causes. The contributing causes of influents in tide such factors as overerowding universality of travel promocuous coughing and specing of individuals suffering from the disease etc. The exciting cause of influence or the particular germ responsible for sitting up the infection is not known.

It is a curious and sugg stive is t that in regard to exact knowledge of the exciting cause of a number of our Care knowing of the extension of a minute in our most common decases we rat aim as as worfully in the dark as was Hipportates the littler of Medicine! The list of desages of disultid or unknown causation includes such continu maladas as small pox mumps who ping cough mosts scarlif fever and influents Leaving out of consideration for the moment the

recent world wide condema of influence whose toll of death so sardonically abetti d the ravages of war (in this country alone estimates place the number of deaths from influenza during the past three months at from one quarter of a million to three hundred thousand) we find that there are few adments which are responsible for so general a physical mental and conomic impairment as are common colds. Universal attention has been attracted to this initially because of its apparent recent outbreak in epidemic and pandemic form erroneously terrind Spanish influenza Confusion has been worse confounded by loose statements in both the lay and included press that Spanish influenza is really bulbonic plague or what is commonly spoken of as the In the rapidity of its spread in its high mortality and in certain of its manifestations in the body the disease has somewhat simulated in certain respects the pulmanary form of plague that dread scourge of the tropics. But just as one or even sveral swallows do not make a summer so do certain similarities fail to

in 1892 Dr R Pfeiffer of Berlin, described a germ

which he believed to be the cause of influence and, in honor of his discovery, the micro-organism has come to be known as 'Pfeiffer's Bacilles It is a tiny rod, one of the smallest known disease producing bacteria, averaging from 0.5 micros 1.5 micross in length and 0.3 micros in the bacter 1.5 micross in length and 0.3 micros in the bacter 1.5 micross in the bac micron in thickness (1 micron - approximately 1/25000 of an meh In 31 cases suffering from epidemic influence, he found this germ in the sputum coughed up from the lower air passages. Independently and in the same year Canon claimed to have found the same germ in the blood of influence patients.

discovered by him was the exciting cause of influenza upon the following grounds (1) The influenza bacillus was found in the pus-laden sput me coughed up from the lower air passages (bronchi) in all uncomplicated cases of influence (2) He elaimed to have found this gern only in cases of influence (3) He found the baoili corresponded with the course of the disease and that when the purulent (pus-containing) secretion from the bronchi ceased, the micro-organisms disappeared (4) He claimed to have simulated in essential details, the disease in rabbite and apes by injecting into the veins of these animals a pure culture of living influenza bacilli

suspended in counton
Wetchealbaum (1892), Huber (1893) Kruss (1894),
Richter (1894) Baumler (1894) Borthardt (1894) rather
quickly confirmed Pfeiffers work as regards the presence
of the influents bacillus in the sputim of patients sufforming from epidemic influense findings which have been
reported by many competent besteriologuis since that reported by many competent baseteriologate since that time. The second and thrid of Pisifiers contentions, vir that the bacillers is found only in cases of influences and that when the secretions case the bacill disappear have been somewhat discredited by the work of subse-quent investigators. In the bronchial secretions of persons convalescent from the disease, the bacillus of Pisifier and infrequently persons for long persons of time Pisifier and infrequently persons for long persons of time that the pisifier is the pisifier of the pisifier of the natividuals for years. His fourth contention is that in rabbits he pixtravenous must tou of nairs callure of H. in rabbits by intravenous injection of pure culture of B

influenza, influenza-like symptoms were set up, is not generally agreed to by more modern bacteriologusts, nor is his statement that by rubbing a pure culture of the bacillus within the nose of monkeys he was able to set up influenza-like symptoms in these animals

When to this is added the fact that, even as early as

When to this is added the fact that, oven as early as a 1892, sputs were reported from uniforms patients, during the source of rather widespread outbreaks of influences in Europe following the great pandemic of 1890-82, in which persentent search failed to show the presence of Pfeiffer a bealfulus although other germs, such as the streptococcus, were found almost if not quite as constantly in the sputno of influences patients, grow which had as much or as intie scientific license for being constantly and the sputno of influences and the had because of the access of the failure and the scientific described the search of the failure and the scientific described the search of the failure and the scientific described the search of the failure and the scientific described the search of the failure and the scientific described the search of the failure and the scientific described the search of the failure and the scientific described the search of the scientific described the scientific described the search of the scientific described had as much or as little scientific litems for being con-sidered the cause of the disseas as did the bacillus cham-pioned by Feiffer, we are given a curously pertinest insight into the not infrequent orthodoxy of science. Truly, we, in whose eyes science has almost the stature of a god, must wake a little more humbly within 'that frill and ill-saured edifice of knowledge wherein we dwall. Until the past year, the Findie houlius has occupied an almost unssaniable position in the halls of Bacterology. and only now is the conception that this germ is the true cause of influenza being shaken from its high sitar

Fuel for the fires of scopticism is added in the form of such experiments as those referred to in an editorial in the such apperments as those referred to u an editoral in the issue of the Sicientific Assets as of February 1st, very recently performed by the United States Public Health Service and the United States Navy (Some Interesting Though Unsure-seaful Attempts to Transmit Influensa Experimentally, Pub Health Rep. 34 33, Jan 10th, 1919) In the series of tests made at Boston, 68 men from the naval detention camp at Deer Island were inoculated with pure cultures of the influensa bacillus, with servetions from the nove and throats of patients in the carry stages of misensa and with the blood of the control of th as were both filtered and unfiltered secretions from the

## Industrial Coöperation as a Factor in Reconstruction

By Frank B. Gilbreth, Mem. Amer. Soc. Mech. Engineers and L. M. Gilbreth, Ph. D.

Till war is over This fact has been known and realized in France and Ingland for several months In America it is not as yet fully realized. The next thing is to return to business

In returning to business we must remember that the first step is to get down to secretific methods to discover install and maintain methods that insure permanent progress. Many programs have been suggested as hest said as positively essential Secretary I are has said that whatever our yews we must realize that the era of the sovereign workman has come. The president if a gre it manufacturing association has stated prisident of a great manufacturing association has stated that its mixings and cipplying segurating must realize that I aget hours and lower pay must be the order of things it this country cann incit diorege competition. The advocates of a high protective tenff and the between in free fault have presented their distributions of the problems confirming, our nation of the problems confirming, our nation that offers that of the problems confirmed as the solution of the problems confirming, our nation. the effect that regardless of conditions prior to the war, during the war it was for labor's interest to make as large individual outpats as passible

I aghsh labor unions now insist that a Shop Committee

of workmen shall have a voice in avery installation of new methods in management

In all these recommendations one feature stands out elearly namely that there must be a recognition of the mutual advantages of hearty cooperation between enquiver and employees and the disastrous effect of atrikes and lack outs on employers and employers and on the public

It has often been thought that the interests of em ployers and employees are and always will be directly opposed but there are many intelligent investigators who maint un that these reterests are not opposed as as generally behaved

The purpose of this paper is to bring to the attention of the workers managers and employers a basis of action for the beginning of a systematic cooperation that will be of greatest importance not only for their welfare but also

for the welfare and prosperity of our entire nation.

The great problem of obtaining cooperation can obviously be divided into subsidiary problems, and we onn select such of these as embody identical interests of all

Let us list some of these sub-divisions on which there no question of conflict of interests and examine them with the idea of fostering special cooperation on these subjects and thus make a start in founding habits of intensive

general cooperation in management and worker Such a list of non-entagonistic sub-divisions of manage

ment would look something like the following

- Acadent prevention
- Patigue surveys and the elimination of unnecessary fatigue
- Cobperative stores
- Regulation of temperature and ventilation Maintenance of hygienic conditions beginning with education on the subject of danger of spitting on
- the floors
- Oral hygiene I get ald rooms for the sick or injured

- I rist aid rooms for the sick or injured Shower baths and lockers for clothes Cafeterias, lunch rooms and casinos Playgrounds and flower gardens Annual plents and shutdowns for vacations Cooperation with public libraries
- - Bicycle rucks and garages
  - Reduction of labor turnover Mutual aid and sick benefit associations
- Laboratories for research in best meth There is nothing new about any of these 17 subjects. They can be seen individually in operation in many

plants great and small, and some organisations have them all working in greater or less degree. The great work skready done in secident prevention is well known. The number and extent of injuries from secretaria in many organisations have been reduced to but a small fraction of previous records. The descrip-

tions of the methods that can be adopted for reducing accidents are obtainable by any one by examining the reports and transactions of the National Safety Council I here are cases on record where organizations have reduced accidents over 80 per cent by accident prevention education. Livery accident affects the injured most but the employer and public are also affected by the loss of output and productivity involved in each accident

Fatigue surveys with the elimination of unnecessary fatigue opens a field for national waste elimination that is fatgue opens a field for national waste elimination that is colosed in extent. There is probibly no field that offers such opportunities for savings in discomfort, for increases in output and for prodouging years of productivity as does fetigue study. The important work of Prof Q F Blessing of Swarthmer College should be known to every manager and shop committee as outlining a practical method of arousing interest in fatigue. The recent discovery that 51 Li per cent of our seldies have been insifted with their shoes (from 71 per cent to 71 20 per cent to omail and 98 tper cent with alone of the production of the prod

to any also actual tupury to one spidless. Many organizations are shread yecognizing the first Monday in Discember oscil, year as fastgue simination of the shread yecognizing the first Monday in Discember oscil, year as fastgue simination day, and are making special efforts for codeperation on this subject with their workers, and it is hoped that the practice will become more universal as years go Europe Cooperative stores are much more common in Europe Cooperative stores are much more common in Europe than in this country, but there are many successful cases that can also be quied here. The unual practices in for employer to furnish the space and for a committee of workmen to operate the store. This results in large of workmen to operate the store. This results in large The regulation of is unpeature and ventilation far too often is swarphody's business, hence subdoy's business. Many times those sitting by the window ubject to (Continued on page 212)

#### Synthetic Investigation of Organization

To the Editor of the SCIENTIFIC AMERICAN

The magnifect conduct of our men in the trenches has been paralleled for two years at least by matchless does at home To this employment records of all was industries beet testimony. From the railroad president dollars-year man to minuters and lawyers working their many than the conductive and lawyers working their parallel of the conductive testing testing the conductive testing the conductive testing the conductive testing testing testing testing testing testing testing the conductive testing t time and overtime as laborers and riveters, the American

workingman, newly composite has fought a noble fight On the other hand, the very opposite is also the case and the monstrous overhead the creation of thousands of high salaried positions for disproportionate brains the opportunity to graft more easily than ever grafting could be done before, has resulted in strange confusion

be done before, has resulted in strange confusion.

Before the war, even System had become a forgotten
cult replaced by Efficiency rampant. The highest aim
of a corporation was to so functionise its personnel that
human beings might be blue-printed like machines. A
stenographer who could not 'take four bundred a
minute was below par, a machine operator whose
arm motions were slightly under rount, was undesirable.

Tests of all kinds controlled. Men of a certain type,
happin, sationality, were accepted for certain or cuprations
and all others rejected. Schools sprang up overywhere
the controlled to the controlled of the controlled to t

Just as one saw the missined product of an obtain a given time from the disappearance of raw cotton into the comber so any man or woman could enter school and emerge after some months qualified for high salary as an efficiency or welfare worker

In the case of cotton it is either dirt or cotton that goes through the comber In the case of the human being no two elements were alike Yet they were boing no two elements were alike Yet they were swallowed in the husk by Industry, and efficiency was still the dominant word. No one realized that the most shining examples of efficiency occurred where Clenus as the Head had been able to support the industrial structure with selected departmental genius

structure with selected departmental gamus. When the war was started efficiency was morthan ever the word and we all know how spluddly it served as a basis to start from, and how little it could be adhered to in the event. If we had not had the idea of building fabricated ships, shipbuilding right have been paralysed, and yet the fabricated ship has played not very glorous part in the war. If German efficiency had not convinced us that the super-training of men was aboutly not have our present allement. necessary, we should not have our present splendid military organisation. But super-trained troops did not bear off all the laurels at the Marne

So it was with our factories. In spite of enormous numbers of efficiency men, in spite of inspectors some-times, as in a recent case at the ratio of one inspector to four workers, in spite of speed and need for speed the amount of rejected material was astounding, the overhead alarming

There is a flaw somewhere May we not say that it is in efficiency not in its aims but in its ruthless methods? In its homogeneous adherence to forms and in its insti-tutional training of men and women?

tutional training of men and women?

We find on our records people of the leasure class of all ages who performed sustained manual labors at record speed month in and month out, side by side with skilled labor that turned floater and lost its earning capacity. No longer can be demanded exclusive types of men. I would not baltitle the true Efficiency, the deare to receive which has turned American wide-awakeness and exterprise to such crunent accompliatment, but I do say that this availables cannot be maintained by machanism.

that this excellence cannot be maintained by mechanical

methods—by settled forms

Let us then reorganise under a new name, both qualitative and quantitative, and call ourselves Synthetic

Investigation.

Sympathetic, it might almost as well be for the quality of sympathety, intuition, call it what you will, as the quality that puts the right man in the right place that shows the Capshals of Industry where to locate, where to find his market, how to build his credit and above all what use to make of the brains of his associates. The Synderic Investigates too, must be endowed with this quality above and beyond all training. He must be added to live that life of the factory he arrange allows as considering as be breathest the as: It is must be shown to the the state of the state of the contraction of the state of the stat

elements that go to make union or disunion duplications, interferences, inflation or over concentration lack of cooperation and above all missis. He must save his forms for the last, to be the uniform made properly and to order, for an organization deserving the tion

To do this he must know much of human nature and be able to see more aids than one. His special mental equipment is worth all the training in the world and his place is in the employment service

This most vital spot in the management of any productive concern, I believe that for such work women are particularly adapted. So far when women have worked in employment, it has been in the hiring of women or in keeping records under the supervision of men or as in one notable instance as the inspirational estimator of men a ability. That should not be the

Welfare that other much abused word represented westere that other much sousce word represented by exponents as often well-trained so often as cold and patterned as chilly squares of lineium in sace should sleing to employment. Food Lodging and Care should belong to employment. Amust ment Preliminary Hir-ing and Pinal Buchargo, being the great media through which may be determined the unspoken forces of an industry also belong to Employment

But the means at hand, however pleutiful is lost if the investigator is the product of education solely and devoid of the knowledge of human nature which is the distunt necessity in the chaice of personnel upon which all business ultimately depends It gaves that touch of scultment to organisation without which in some form

I know of no really successful individual or corporation Instead of laying stress on our profits from production e should beast of increased localty and contentment a saving due to a minimum turn over This I enture of a saving due to a minimum turn over This I enture to predict will be the better item of the two in dollars and cents and certainly far more economical and credit

It is plain that many large employers now feel this The time has come when I flict ney must join hands with Entrusted to conscientious exponents trained and inspirational, industrial organization will be care fully examined and the pride of the expert will be not in how many factories he has squeezed into the mold of his forms and system, but in the successful resource fulness and adaptability of which his system is the

GENEVIEVE W MARON New York City

## A Definite Plan for Physical Reconstruction in the Devastated Areas

To the Editor of the SCIESTIFIC AMERICAN We all know that parts of France have leen destroyed by the invader, perhaps we are n t all clear as to the extent to which the destruction has here carried. We may therefore revert to M. Tardieu s address of Novem-8th last in New York, where he stated that in the devastated area 350,000 homes have been demohshed. 90 per cent of France s spinning and weaving industry put out of action 83 per cent of her hig iron production out off 70 per cent of her sited production sent off roll per cent of her sited production similarly affected an equal proportion of her sugar industry destroyed. In this region, which formerly paid onedestroyed In this region, which formerly paid one-quarter of the taxes collected by the 1 rench Government everything has been carried away or destroyed literally nothing is left. All this must be rebuilt. How? We have lost two and one-half million men. A

fitteenth part of our people is missing at a time when we need all our material and moral forces to build up our But beside this restoration we understand rapidity of execution is a primary condition of the reconstruction of France and that the United States by its immense possibilities of production must be our first. be our first aid

In brief there is nothing in the way of building materials adulpment, domestic utenuls industrial machinery that is not needed in very large quantities

and at once The Construction Division of the United States Army has here in America 30 million dollars worth of building materials that have never been used. When to this is added all the material of like nature from the other added all the material of like nature from the other departments here and in Finner, when to this is added what can be salvaged from the demolstion of army plants and civil plants that muss be abandoned the figures become staggering. The Construction Drusson alone construction and the contraction Drusson alone pound loaves of breast jet ed. Out of one group of temporary offices buildings alone there will soon be available 12,800 plants, 23,000 good office deaks, as many typewriters, sleetled fans and other equipment in prepartion. And so it goes on all addes Intractories are being prepared showing materials on band. It will take some time to complete these Mean-

while it is safe to say that the component which was used safeguard morally and spiritually 4 000 000 men as no body of men were ever cared for before will go a long way toward the qui k reconstruction of communities aggregating 350 000 houses at least until such time when a new generation may without suffering and want provide for itself more in a crdin e with its own

Moreover the Construction Division of the Instead States Army one of the most off the regarizations of the sort that ever was get together as still intact It still possesses its construction equipment with the operation of which it is familiar. Its labor is connect tion with the conduct of war is alm at huished within a few months it will have been distanded. To allow it thus to disintegrate while this great construction demand exists would be an economic crime. The majority of these men would be willing to get a leaner of they could continue their present organization and be permitted to work by the methods that they have made so success to work by the methods that they have made so success ful. At the invitation of the Irench Engineering Societies and the Irench Government a representative body of American engineers is now in Paris conferring with the French regarding municipance and construction of all kinds for the devastated areas delegation returns to this country and advises as to the exact state of affairs we should be ready to take instant

action

In a word let all building material and other equipment owned by the Unitel States Government hoth
here and in France and purchased for war purposes be nere and in I rance and purchased for war purposes of collected. I has will include inaterial not yet used as well as that salvaged from the demolition of war plants Let all such inaterial as can be used in the reconstruction of I rance he turned over for that purpose and delivery expedited to the utmost of our ability Let the Construction Division of our Army or such part of it as can profitably be so employed go to France to cooperate in the utilization of this material. I inally let all this be considered as a part of the cost of the war to be included in the bill against Germany

the destruction. The principle

Germany has done this destruction. The principle of reparation is accepted. But reparation by cash payment is notoriously inadequate and direct reparation is slow and uncertain. We however are in the ideal position to bring about speedy and effective reconstruc-tion while slowness of payment provided ultimate payment he properly secured is of not the least con sequence to us. And eash payment when thus made to

#### Another "Original" Toothless Saw To the Edit of the SCIENTIFIC AMERICAN

Here is an earlier date for a toothk ss buzz saw thau any I have seen mentioned in your paper. When I was a young boy (born in 1838) I lived from 1845 to 1851 eleven miles northeast of this city. One day I walked two miles to see a wood turning machine shop owned by John Joslyn who turned handles posts rounds etc various kinds of pioneer furniture and implements He took great interest in showing inc the various inschines and lastly attached to the lathe shaft a toothless disk six inches in diameter which he had cut out of a plate of common sheet ir in Giving the disk a very rapid motion he cut through a large steel file several times a stream of and out through a large sect in several times a stream sparks fluing 20 inches or more away. I know this was previous to 1851 because my family movel from that vicinity in March of that vicar and as it was warm weather whom I visited the shop it could not have been weakurt whom I visited the sholp it could not have been later than the summer of 1850 and proi lably not carber than the summer of 1849. If lave these dates before me in my father a antobugraphy. I think the idea of that particular saw was original with Mr. Ioslyn.

I have been a continuous subscriber to the SCIENTIFIC AMERICAN for forty five or six years and consider it is the most instructive journal published and expect to take it as long as I liv

## Airplanes for the Transatlantic Flight

What Aircraft Constructors Are Doing Toward Making the Great Flight Possible

I it were merely a matter of providing a suitable If it were merely a matter of providing a suitable machine the transattains flight wild by now be a fast accompt. For it is a well known fact that Great Britain Germany and the Intel States and perlaps France and Italy as well have so trad surplants now available for the or issuing if the the usands of miles of ocean. Other fact its hay of derived winters from maken. ing the attempt although many signs point to the suc-cessful accomplishment of the feat within the next few months

Among the transatilatic airplane possibilities is the scapiane of tapt Hugo bundstell a Swedish aviator now in America will his more or less completed his preparations for the great trip bundstedt a machine at present writing is riding on waters of Newark Bay, off the southern and of Bayonne N J As yet the machine has in tecesived its final tests preparatory to the first leg of the transatiantic journey which is from Bayonne N J to some point on the Newfoundland

The mount designed and built especially for Capt The mount designed and built especially for Capit Mondat dit as hiplan of huge proportions resting on two long postocous. It has xxx.pitonally graceful lime as compared to the squitty appearance of similar sured machines of the fiving boat type. The upper plane, has a spread of 100 feet while the lower plane measures 11½ feet. Between the wings and well in front of them is the state of the same state of the fiving the proposed of the state of the same state of the fine five first proposed. Back of the cabin stretches the fuselage or framework terminating in a simple (penage or tail. The cabin is provided with four a its upholstered in artificial leather—two for the two pills and two for the two mechani-—two for the two pill has and two for the two mech humans who are b! make the trip. All the controls are installed in diplicate so that if one set should be constanged on other is available. Maps and meteorological data are plated in front of the pilots together with compasses and other instruments. One other saids of the cahm is a save-plated listle-Sott organe rated at 220 horse-power and enclosed in a stroum-line canning the engines delivering a both of the power of 440 horse power driver two propellers. I he

total lifting area of the acapiane is given as 1 537 square feet. The weight is 10 000 pounds. The estimated speed is 80 miles an hour

speed is 80 miles an inour Capt Syndrodisch is 80 miles an inour Capt Syndrodisch is no aviator of long experience. In July 1914 he made an airplane flight from Bue in Irane to 8 tooksholm in "weeden or a matter of 1.200 miles without landing. The time for this trip was 13 hours and 20 minutes and considering the comparative crudeness of privair machines this was no mean achieve-However at as well to call attention to the seem ingly low horse-power of Capt Sundstedt's seaplane Most machines of equivalent sire are equipped with two togenes of the I therty or Rolls-Royce type delivering some 800 or 900 horse-power as compared with his 440 horse-power. It is true that the (aptain has made certain important improvements such as cutting down his head resistance to a minimum and cutting down the weight all round I or metance his pontcontaining 32 compartments are made of the lightest wood and weigh surprisingly little. But the fact remains even if the machine is of the seaplane type as

Capt. Sundstodt's seaplane in Newark Bay, during trials

contrasted with the somewhat heavier and more cumber -boat type, that his power plant is considersome lying-boost type, that his power plant is considerably loss than what is generally accepted as necessary for such used craft. This would seem to mean them while Capt Sunsted's mentione should be capable of flying and flying well, it is not capable of meeting adversed conditions, such as storney counter words, which are almost certain to be met on such a lengthy flight Iurthermore such a mankler fully loaded could hardly, if at all iffy with a single took r which means that during the entire passage the two engines must furnitum particularly.

Cabin of the Sundstedt scaplane which contains four seets and dual controls

In a word, Capt Sundstedt's machine, given ideal flying conditions and the very best of good fortune, ought to be able to make the transatiants journey. But in no wise does it appear capable and ready to confront adverse winds, rough seas—should it have to alight for repairs and adjustments and then take off again and other deterrent factors. Planky, it does not anticipate such disadvantages. There is no factor of safety or should we call it factor of hard tuck?

Aside from the Sundstedt machine, the United States

has another entry in the transstantic flight in the form of our Naval machines. On February 5th, the Navy of our Naval machines. On February 5th, the Navy of the property of the development of plane and assembly of the development of plane and assembly for the attempt the Navy has several machines available, especially the hope block of the type-host type, known as the N C 1, which was described and fliurisated in these pages come time ago. The N C 1, which has with three Liberty waspess or about 1,200 horse-power unit of the control of the type of the

more than sufficient for the transsitantic flight. The trum-engined flying beats of the Navy, which were also described in these columns, are available in large number. These planes, equipped with two Liberty segmes, each furnishing about 400 horse-power, could be made to carry suffuent fuel for 16 or 29 hours flight if the transsitants flight were made in two or three jumps, so to speak, with mother ships along the route to furnash fuel and other supplies as well as anable erews to make repairs and slight deplements, these F-5 type planes could readily make the journey. But if a non-stop state of the suffer of

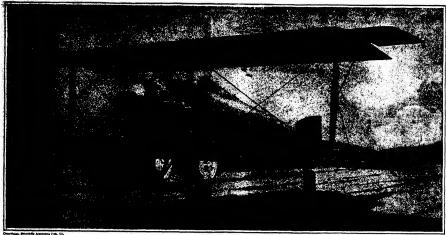

made public

made public
Turning to Europe, we find our Braisis cousins working hard to get an arpiase started on the transatiantic
journey A number of machines are already available,
and are receiving their finishing touches and "funding" to be followed by extensive trial flights One machine
for the coming context is the Porte "Super-Baby" triplane flying boat, designed and buils for Liest Porte,
who will be remombered as the young Bratish navis offices
who was to attempt the flight in 1914, but where plane
were interrupted by the war. Liest Porte's present
mount has a span of 122 feet, a fuelage length of 60
feet, a height of 27 feet 6 inches, and a total weight of
28,400 pounds. The two woren rianes are of the same iest, a neight of 2' lest o incises, and a total weight of 25,000 pounds. The two upper planes are of the same span while the lower one is somewhat shorter. The column included in the flying-host member. One commendable feature of the Porte plane is that it me quipped with five Rolle-Reyce motors of shout 250

it is equipped with new Rolls-Reyres motors or show say horse-power such, arranged in two tandem sets and one single "pusher" So it in evident that Lieut Porte means to take no chances with sugine failure be has discounted the darkest kind of misfecture by having at least two angines to the good, that is to any, by having two engines more than he needs for plain liying

Two views of the Sundaindt sentions designed and

Oppose a model according to the ascriai commuter. It starts and alights on an ordinary road. It makes a speed of over 100 miles an hour. And it costs no more than \$2,000!

## Every Man's Airplane — A Big Step Toward Aerial Transportation

The cover illustration of this issue is based on solld fact. It is not an artist vision of the future, but a drawing of what can be done and what is likely to be done arrived to the future, and the scale of the future processes of the community within the realm of immediate realization for all persons who have hereinfore been able to afford a motor car.

The machine is a single-seater biplane, designed by of long experience in sirplane design and Captain James V. Martin, who will be realized see a man operation. In reality, the machine was designed originally as an allitude fighten, provision being made for oxygen tasks and electrically-hated dothing; but with the termination of hostilities Capt. Sartin has turned over the biplane to pescoful pursuits with very few structured changes. tural changes.

entirely of three-ply timber. The system of wing bracing also is unusual, as is the arrangement of the under carriage which makes it possible for the wheels and the (Continued on page 216)

## How Passengers Are Taking the Place of Bombs in Airplanes

THREE months ago it was a question of building planes which would carry a large cargo of bombs to the distant cities in Germany. Today, the same machines are being converted for passenger carrying, and the question is offs of carrying the most passen-

gers as rapidly as possible so as to compete with the more procaic means of transportation. The accompanying illustrations are of immediate

The accompanying illustrations are of immediate interest in that they show how two well-known types of bombing planes have been converted into passenger-sarying planes. The machine with the cabin body is the big Farman biplane now being employed in Paris-England service. The machine has a span of 92 feet, named to be a span of 92 feet, and the property of 92 feet in 10 can climb 1,000 feet in four minutes, 3,000 feet in 10 can climb 1,000 feet in 10 can properly of 10 can be seen to 10 can be

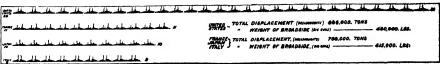

A dosen passengers can be carried if they do not object to crowding.

The other machine is a converted Caudron twin-engined bomber, also equipped with what appear to be radial engines of the Salmson design in both wingplanes. In the case of the Caudron, however, the In the case of the Caudron, however, the In the case of the Caudron, nowever, one fusedage is arranged with a huge cockpit so as to hold the passengers without other protection. The Caudron appears to have a wing spread about the same as the Far-

## Cost of the New Three-Year Naval Program

Moving Up from Millions to Billions in Naval Estimates

feeling uncasy over the fact that the productous scale upon which naval and military appropriations have been upon which have and ministry appropriations need to wool during with times his upset the sine of values among our present giver in it officials. Nowhere has this change been min in reked than in the Navy Department for whereas in the years preceding the war the conservative estimates of mayal necessities by the General Bour I were received with positive dismay by naval ecretaries and denounced as extravagant and militaristic by naval committees both of the House and the Senate today when the war is over, appropriations infinitely greater than those that were asked when the German

menace was lifting its throatening head over the eastern horizon are bitthely presented by the 'ceretary of the Navy and enthusiastically endorsed by him, not only in afficial reports and in hearings before com-mittees but in public utterances upon the platform and in the press
One of the most commendable

pledges with which the present govern pledges with which the present govern ment entered upon its high duties and undertook its solemi national obligations was that of a careful con-servation of the public moneys and of an economy which should strike a reasonable mean between wild ex-travagance and a parsimony which would be fraught with national peril Surely if there is ever a time in the anairs of a nation when there is a tail for strict economy it is at the close of a war of the first magnitude and in the presence of the enormous debts that such a war inevitably leaves upon the shoulders of the people. The citizens of this country who have made such a noble response to the call of their government for a curtailment of their personal expenditures so that they might make a generous response to the government call for money feel that they have a right to look for a quick scaling

down of government expenditure now that the war is over Hence, they have viewed with dumbfounded amazement the call of the Navy Department for the construction of a new flext whose cost will be equal to that of the whole of the existing flext which we have built up during the past quarter of a century.

It is a very simple thing to ask Congress to authorize a three year program it is not so casy for the mind to grasp what an enormous sum of money must be expended. not merely to build the ships of that program but to maintain them year after year. It is the purpose of the present article to translate these millions and billions of

dollars into concrete every day terms, which will bring home to the average Ameri can a sense of what such oxpenditures actually mean

During the discussion of the proposed new three year program before the Com-mittee on Naval Affairs of the House of Representatives Secretary Daniels presented an estimate of the cost of maintaining a may of the This estimate was drawn up by Admiral 8 McGowan aymester General of the extraordinary materest, be-cause is gives not only the cost of building the proposed three-year program, but also three-year program,

fleet previous to 1916

flect pr vious to 1918. We find from this statement that the original cost of the flect, evaluate of the three-year program authorised by act of August 29th, 1916, was 3773 000 000. The estimated cost of the three-year program act of August 29th 1916, as 7671,000,000. and the estimated cost of the proposed three-year program as originally proposed was given by Admiral McGoroma as 891,000,000. It must never be forgotten that providing the money to build show as meany to be the control of the proposed three-year program as originally proposed.

build slaps is merely the beginning and not the end of the expense. The ships must be maintained and the maintainent of a fleet is an enormously costly thing. To

Eleven eighteen-foot transcontinental highways of concrete could be built for the cost

quote from Admiral McGowan's estimate if the 1916 three-year program and the second three-year program be completed the annual cost of maintaining our en-larged navy will be about \$700 125 000 per annum for yessels in full commission, in reserve commission, and

In 1913 when the threat of war existed and the menace of German ambitions was well-understood in overy government of the old and new words the annual cost of maintaining our navy was \$138 000 000 Today, when that threat has disappeared with Germany navally impotent for a generation to come and with every great naval power our close friend and ally, Mr Daniels is

program of 1916 and the original cost of the existing fact privous to 1918. We find from this statement that the original cost of the flow, exclusive of the three-year program authorised by act of August 29th, 1918, was 377 5000 on The stimated cost of the three-year program act of August 19th 1918, as 781,000,000. The stimated cost of the three-year program act of August 19th 1918, as 781,000,000 and the estimated cost of the proposed three-year program as originally proposed three-year program as originally proposed three-year program as a 581,000,000. the Pennsylvania Kaliroka 1 eriminal (\$1.5,00,000), the Adams Express Building (\$8,000,000) and the Metro-politan Life Building (\$8,000,000). Thice monumental structures, known all over the world for their size and cost, total altogether in value \$46,050,000. A vast sum, truly, and yet we are asked to spend

for our new navy over 16 times that sum of money

So much for the monetary and of the no mucu for the monetary said of the problem as affecting the national treasury. Let us now bring it down to the more intimate relation of the pocketbook of Smith, Jones and Robinson The cost of maintaining pocketbook of Smith, Jones and Kobinson The cost of maintaining the navy of 1913 was 85 90 per family per year. The cost of building the new navy, as represented by the two lives year per section of the present of the cost of building the new navy, as represented by the two lives year of the present of the total cost as given above, but it is certain that, if the present of the control of the present of the total cost as given above, but it is certain that, if the

advocates of an enormous hat, of the advocates of an enormous hat, of the advocates of an enormous hat, of the advocates of an enormous hat have their way, these battle-crusers will figure in the bull as finally put through. The bill, as passed by the House, calls for the ultimate expenditure of \$750,000,000 It, on the Scientific Aspects believes, the oxpenditure will be absolutely unnecessary, let us consider what could be usefully done with this lung sum of money Nothing promotes the prospenty of a country so greatly as efficient means of transportation. We need a system of good roads throughout the United States. Now a fifered-mass lifetoc encorate order can be built for an average.

of good roads throughout the United States Now as instructions in Proc. conserver one can be built for an average cost, including both easy and difficult country, of \$30,000 per him. Divide this \$30,000 me to prespective cost of this second three-year program, and you will be the present administration processes to be willing to apsaud on an unascessary addition to our navy, would build fire the production of the contract of the process of the contract of th try from Canada to the Mexican border and the

> Why does the SCHENTIFIC AMBRICAN consider this second three-year program to be quite unnocessity? For an answer we direct at-tention to the diagram at the top of the page 13 shows, in allhouste, the number of divariations by the United possessed by the United

Cost to each family in the United States of the preposed big nave

naval powers, France, Japan, and Italy, when our 1916 three-year program and their own existing programs have been completed. At that time the United States will possess 29 dreadnoughts, most of the them the biggest ships of their kind affect. France will have 11 dres

France will have 13 dread-noughts, Japan 10, and Italy 9 That is to say we shall have 99 dreadnoughts as against 30 for the next three powers But our 29 dreadnoughts will have a total displacement of 886,000 tons as against 788,000 tons for the three combined fleets of our allies, moreover, our total broadside for the fleet will be much greater, namely 460,000 pounds against \$15,000 pounds

The SCIENTIFIC AMERICAN has always been a big-I'm SCIENTIFIC AMERICAN ans siways been a Dig-navy 'lournal; we stand for a big navy today, and we believe that the construction we now have in hand will give us, as shown in this diagram, a navy amply sufficient to show the fing and protect our interests in all the seven seas

#### Handling Coccanut Oil in Bulk

NEW methods of handling coccanut oil at Pacific N are new in successful operation Previous to the war, the bulk of the oil was shapped to Europe, but with the closing of European ports great quantities came to the United States 1t is estimated that we will reselve soonants oil to the value of \$80,000,000 during

the year 1919
Until recently the oil was shipped from the Far East in cases and barrels. The excessive cost and great waste o this led to the attempt to ship in bulk. The problem was a difficult one because of the fact that the oll solidifies at 70 degrees Fahrenheit. Experiments in provious was a uniquest une poscusse of the fact that the oil solidises at 70 degrees Fabrenheit Experiments in running heating tubes through the tanks of vessels, storage houses and care have now reached such a stage of practicability that bulk shipment of occount oil is penised as having arrived

This enables tankers which have taken cargoes of Into enables tankers waten nave taken cargoes or refined or jubratung oils to Asiatic ports to load to espacity with socoanut oil for delivery into bulk storage on our Paosine coast, and subsequent distribution in tank cars. One of the first companies to enter the field has set up a storage plant in San Francisco, with a complete set up a storage plant in sea "Faceline", with a comprese equipment for getting the oil out of the steamer into storage, and out of storage into the tank care Six-inch pipe lines lead from the storage tanks to the piers and to

pipe lines lead from the storager couplings are made with fearble steel hose When the coccanut oil is pumped into the steamer's hold in the Orient it is of the consistency of heavy fuel oil. The scheme is not to minima in in this state oil The scheme is not to maintain it in this state throughout the voyage, but to let it freeze up as solid as it pleases while the vessel is an route. It is marely mosesary to have the oil at pumping consistency on arrival, so steam is turned into the heating tubes while the ship is a day or two out of San Franceson. In the same way, the oil is allowed to solidity in the storage tanks and again in the tank care, and steam turned into the heating tubes of these units only whon it becomes necessary to reduce the oil to flowing consistency. In this way a great deal of steam is saved, in fact, it is this allow that makes the first the commenced of 
alone that makes the process a feasible one commercially at the storage plant the oil is never purposely permitted to remain in the storage high like ledding from vessel have been empited, steam or compressed sar is introduced into the outer end of the pipe line behind the oil, and all of the latter remaining in the line is forced into the storage tasks. Nevertheless, there is danger that the oil will become hardened in the

pipe line and obstruct the latter wholly or partly So a one-inch heating tube is carried down the center of the six-inch pipe, returning on the outside of that pipe to the boiler room. By turning steam into rouit any oil that may remain in the six-inch line is soon melted out. The lines that are used in filling the tank cars are similarly equipped with a heating core, hers, however, after filling a car the oil as permitted to remain in the filling line, to be melted out when the next car rolls

into place.

The oil gramps on board the vessel and at the storage plant must be equipped with a steem jacket, as else provision must be made for the certain draining of all oil from the pump immediately respectively. il oil from the punny man processing in a punny mention cases. Oil allowed to remain in a punny-bat has no steam jacket would now wildly; and then a pressure of 100 pounds of steam would not suffice to clear the tubes.

### The Labyrinth of Chemistry

WHY is it that most chemical manufactur is inv stead of turning out several grades of the same product, as seems the rule in most fields produce several compounds of radically different nature, and but ne grade of each? Why, in the lists of war contraband assued by the English and French Admiralties do we find such stems as fallow and other? Why was it in sable after more than two years earnest effort make American dyes as good as those previously im

ported from Germany?
The answer to all these questions in the same—because

showing the interdependence

of the interdependence of the chemical industries. interdependence must be clearly visualized not only for a proper understanding of the historical development of a given chemical industry, but likewise for an adequate a given chemical industry, but likt wise for an adequakt grasp of its present economic state. No proper non-grasp of its present economic at the control of 
the factory had to be located in reasonable proximity to salt mines or marshes lite depended upon the action of sulfure acid and since this w-priced and very dense. sul stance cannot support timep station charges acid fictory had to be tuilt mean tion with the side

works. But the process of meking sod in selffer in this way involves the formation of an equal side flished chloric and vipor—this must be recovered to avoid pollution of the air and is then does lived in water to form the commercial acid So that to make an alkali words More than that it was necessary to prepare two reads the commercial demand for s das for exceeds that for hydrochloric said that the full preduction of the latter only domanding that the extess be used up in some way it was transformed into chlorine and then into ble ching

then this old process for making artificial sida, which can be completely expressed chemically by means of the simple equation

#### 2NaC1+11/5()4=211(1+NnaS()4

must, from the industrial point of view be set forth in the following chart in which rise materials are entered in italies, intermediate products in ordinary type and finished products in capitals

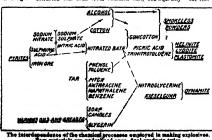

We have seen that hydrochloric acid is sometimes prepared for the doubli purpose of removing the noxious vapors from the air an i converting them into a product of value. In metallurgical operations involving the rosating of ores containing sulfur the sulfur laden vapors receive analogous treatment. But just as the users of this acid have to make it because it will not support transportation charges so the makers have to use it for the same reason. This they accomplish by making fertilizers and often nitril acid. They can sell these at a low price because they do not have to figure the cost of then sulfurous vapors in actual money as an ordinary producer would have to do. Of course such facts are most important in an economic survey of the industries concerned They may be charted as follows

Of course the facts set forth in these charts are sometimes modified in their relations to each other instance for from being a mere waste product utilized to prepare bleaching powder the hydrochloric acid of the that that is in some places the chief product. This is the case in the gelatine factories which use large quan-

tities of this acid to dissolve the nuneral constituents of the bones. In such fuetories it is to be remarked that the preparation of hydrochloric and leads to sodium sulfate as a hy-product, and that the manufacture of sulfuric acid is forced as an intirmediate raw product leading to the hydrochloric. Likewise in many explosive factories the manufacture of sulfura acid was established in order to reduce the cost of the nitre acid which could then be made

This nitric acid is the fundamental base of all our modern explosives, and it is for this reason that thic saltpeter (sodium nitrate) is not permitted by the Allies to enter Germany Reference to our third chart, which sets forth the principal ramifications of the industrial chemistry of explosives, will also explain the blockade on alcohol, ether, giveerin and cotton, in addition to showing how essential it was (Continued on page 216)

he chemical processes employed in making explosives s are underlined once, final products twice

## Speeding Up the Drier How an Operation Once Left to Sun and Wind Has Been Brought Within the Mechanical Field

WIII'N primitive man wanted to dry anything he exter the pricess he heard how to supplement or it lace the sun's heart down to supplement or it lace the sun's heat by artificial fare of his own. He must doubtless have obsaved that the question of air supply had something to do with the matter he cannot supply had someting to do with one makes as sames have failed to observe the difference in drying on quiet and on windy days. But that was as far mache ever got and that was where the matter rested until a very recent date. Means for supplying a more intense heat or a more intense draft were provided from time to time but this represents mer by a difference in degree, not in kind the advisability even the possibility of regulating the heat and the air in connection with the drying operation

nest and the hir in collection with the orying operation seems to be distintly a twent in c. intury conception. Now that this idea has been developed, however its application is being pushed in all fields where drying is done and it has lied to a fundamental revision of the realized that at different stages of the drying the material displays different degrees of moisture cont at and that its most advantageous treatment is to be gained only by subjecting it to different conditions of heat and ventilation suitable to these several stages. But the conditions which are not suitable for the material which has passe is a certain stage and from which therefore that material must be removed are exactly suited to such of the material as is just entering the stage in question. This observation leads to the progressive system of uve system of drying in which there are a number of stations in the

drying apparatus with dif-ferent conditions of tempera ture ventilation and himil its provailing at each 1 very article to be dired passes successively through each station remaining at each for the proper length time. In addition to mire chilous alvantages this system makes it pessible to conduct the drying with due regard to the fact that in certain degrees of saturasensitive to sudden removal of large percentages of its moisture content than it is at others, and that accordingly certain stages of the drying need to proceed slowly under pain of damage to the substance under treatment

This consideration is met in the seasoning of woods by the progressive system—an undertaking that has been fixed upon us, in lies of the sider and more dignified process of seasoning through months or even of years, by the necessity for speed in the production of wood for arriplanes and ships. When we ennot wait for the old process to work out we must d video big furnaces for escaponing wood artificially, and this is what has been

Each drying room consists of a tunnel holding a train Each drying room consists of a timel holding a train of ears of timer the care being a vanced periodically, say as; feet per day, in their pr grees from the wet end where they are located into the system toward the dry and at which the duly seasoned wood is discharged for this purpose, a line of rais rims the length of the successive chambers. Beginning a very most air, the drying proceeds in slawly into using temperatures and slowly decreasing humdities though the air used horoghout must be more or less insist to avoid case hardening and consequent injury to the wood. The drying gent is low-posers retering usually raised from wood refuse in the cheapest kind of a boiler. The latest his sto file steams it stand rend to be cerulating

latent heat of the steam is transferred to the circulating air, while the heat of condensati n is returned by a pump to the boiler Controlled on ulation is assured by introducing at the loading end a little to chill the air to the point where it is almost saturated, and by discharging to the atmosphere such air as becomes wholly acturated. In this way a rotary circulation of air is obtained without any mechanism tho great bulk of air being recirculated ai I relead to in the upward travel through the steam radiators, which are suspended below the rail level

travel through the steam radiators, which are suspended bloow the rail level

This system is largely used both in sawmils and in private establishments throughout Britain for drying. The progressive seasoning of wood as a British development Other applications of the same idea may be found in this country. First to crear to us is that in the drying of vegetables, interest were something like the two the country of the same idea may be found in the coloniant of the same idea may be found in the coloniant of the control of the

type, which roll up like a deak top when it is time to promote the various charges from each channes to the next. With these carisins down in their working pos-tion the chambers vectors a strong deaft from the adde, the whole idea of the untai-

lation being to gave and well pontre

General view of apparatus for continuous drying of letch

#### Packing Curv for Ships

All of the visuality of the control 
our rat/roads

Chean transportation was in an even core serious plight by reason of the fact that reasons were being suit faster than they could be replaced and yet were called upon to early across the Atlantic a variance and the serious could be replaced and yet were called upon to early across the Atlantic a variance and the serious form the serious period in time of peace with the serious period in time of peace with the serious serious period in time of peace with the serious attached to every opho foot aread. This led to an urbeautive study of methods of packing with the result that many negative methods were volved. We have

that many ingenious methods were evolved. We have shown several schemes of stowing motor vehicles in rail We have road cars. Another such scheme which has been used to a considerable extent a shown herewith

It is a plan for stowing motor trucks on flat cars Two cars are mounted on the main floor of the car and fill it completely but there is still plenty of room overhead and so two slevated platforms are constructed on which the wheels of a third oar are supported. This furnished a good method of shipping assembled oars. For overseas transportation it was necessary to ship cars in knock-down condition, so as to make an even more compact load as to make an even more compact load Our smaller fillustration shows a complete motor truck disassembled, with the parts coarfully stowed in a minimum of space ready for boxing. It was by using packing methods such as these that transatianit steamers were analied to carry record-bracking eargoes to Europe

## New Alloy That Does Not Oxidize or Change Its Form at High Temperatures

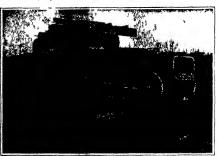

THERE is a distinct demand for a metal Tor an alloy that will withstand high temperature without any large alteration in tensile strength or especially any change in its physical appearance such as soling or oxidising. If toughness as well as results

oxidising. If toughness as well as resutnance to change of form are combined with the foregoing
qualities, then a wide field of usefulness at once becomes
possible if the metal possessing those proporties is
also machinebles, then its value is increased.
A new alloy is being successfully and commercially
made on a fairly large soils, which is distined to possess
all these proporties and which is being used to ad-

A complete motor truck packed for boxing

vantago mesvezal distanct fields of nadustrial application lt is composed of about 60 per cent mickel and 14 per cent chromatur, the remander being pracipally reen lt is being melled in crucibles and poured in sand molds an a special foundry for this purpose. It can be cast easily and in about any shape and in any weight up to 1,200 pounds. The fact that it can be used in practical

Mounting three motor trucks on a flat car

service at high temperatures with extremely long life compared with fren or steel has enabled the producers to find many important industrial uses for it Beades its ability to withstand high temperatures up

Beades its soling to withstand mgn temperature up to 1,800 to 2,000 degrees I shrenhet without shoration in form and with negligible oxidation, the new material possesses at these temperatures a strength of about

30,000 pounds per square inch. It melts at about 2.800 degrees, and when coll it has a tensile strength of about 45.000 to 50.000 pounds per square inch. In ad h tion to its unusual strength at 1800 degrees it is very tough at that tempor atur and will bend considerably befor breaking even when red or white hot. A demonstration of this quality is often in a leby the company by heating to a red heat a plate of the all 14 ment there and then striking it ofter with 120 pound sledge on the unsupport d cent r of the plate Stul born resistance to bending has been the result in each case

The general industrial application of this new alloy has broadened until it embraces annealing and carburizing boxes heating

retorts and convey or chains used at high temperatures is being incorporated in the valve seats and valves of internal combustion (ugines were baskets and other utensils where either heat or acris and chemicals or both at once must be withstood. It is the claim of the company that these annealing or carburizing shapes last about 6 000 hours as compared with only 200

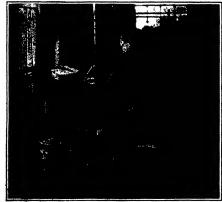

to 250 hours for steel boxes under similar conditions lie fact that it does not ovidist and scale off enables the boxes to be made thinker and lighter still man taining the strength and also insuring more

efficient heat conductivity
The company itself has a practic l
application of the use of its product which
is interesting. In the heat treatment of the alloy picliminary to drawing into wire it is necessary to pass it through an an nealing furnace at a temperature of 1 600 degrees. The ends of the furnace must be seaked with water to prevent oxidation by air The wire is carried slowly through and out of this unueder on an endless chain Because repeated heating and cooling Because repetited heating and cooling would soon destroy an ordinary chain the company uses one made of the alloy tiself which has met the conditions extremely well

Another important application is the of this alloy as pyrometer protection tubes. This type of tubes in the cast form is said to be extensively used and to be rapidly displacing the easily broken porcelain ones. In one case such metal tubes showed a life of 4 000 hours

The question of the use of this alloy for crucibles is now a matter of research and holds out some promising encouragement Experiments thus far in dicate the possibility of its adaptation to containers for melting brass, bronse phosphor copper and other alloys successfully buch a substitute for graphite crucibles would be a decided advantage under present conditions

This basket, of the new heat-resisting metal, is dipped in a het cyanide bath without interv

## Inventions New and Interesting

A Department Devoted to Pioneer Work in the Arts

#### Handier Hammering

THE accompanying illustration shows a novel labor saving device irranged practically to attach a nucleasted ban l to the hammer and let it st the nails for the harmer in some cases one man does the work of tweeten with this device in many places the orjenter needs a helper to hold the board while he drives the nail. With this leve concerns can do it alone as he can held the board in place with one hard while driving the nail with the other. A one armed man equipp I will the levice, can drive nails as well as his two handed brother thus op ming another field of labor for him

It is pointed out that many carpenters have been killed by fulling off scaffolds while working in dangerous places be-cause they had to use both hands for ork leaving no opportunity to hold on With this device one can nul as far as he an reach and still hold on for safety with the other hand. It also does away with holding nails in the mouth

It is pointed out that because of the long reach possible with a hammer times when no scaffold is necessary, and where one is used it does not need to be moved up so often

This automatic hall feeder was developed at Grand Rapids Mich, and is a light, durable device which is attached to the hammer handle accurately feeding

the nails to the hammer

It is claimed that anyone can attach this automatic nail feeder to a hamme handle or remove it in a few seconds After attaching it is only necessary to fill the magazine with nails, then by pulling the trigger towards the handle, the takes one nail from the magazine, sets it right under the hammer

It is only required then to hold it in this position and at not firmly into wood, releasing the trigger and the hand re-leases the nail and drops back, leaving hammer free for driving nail home. It is not necessary to but the mark with the nail attached to the hammer, as might appear. It takes any kind of nails such appear it takes any sind of naiss such as shingling, finishing common, coated flat-head, without difficulty. The capacity of magnaine depends on size of naiss used. It holds about 40 sixpenny nails and has a net weight of only 7 ounces. A good running mate for this hammer is

a novel nad handle which saves a great deal of time. The busy packer must have the nails all the same way in his hand if he is to make time the nade are gone he grabs a handful from the keg and spends nearly a minute ~ an average of 45 seconds to be exact -m sorting the the Handy Nad Handler he can scoop up a handful of nails, have the heads all one way, and begin nailing

onds a saving of 40 seconds over the old

The handler is to all intents and pur-poses a hig comb It is only necessary to dig it into the nails, scoop up as many as it will hold give them a quick shake so that the nails will settle on the prongs, and one has a handful of nails with the heads all arranged the same way.

A magazine hammer which makes it possible to nall with one hand

which have long been sought, but which have either been entirely lacking or have existed degree in so-called "cushion wheels

The limited amount of remilency in the solid rubber tire and the lack of durability in the pneumatic tire for motor trucks, have led to the introduction of various types of "cushion" wi but usually advan-tages gained have not been sufficient to offset the duad

vantages The most of these wheels have obtained their resiliency by means of aprings which not only produce ob-jectionable recoil, but also inevitably crystalize and become useless

In the new wheel there are no springs, no working parts and no parts that require renewal during the life of the truck These wheels are practically the same weight as the ordinary solid wheels now

Handling nails by hand and with the comb-like instrument here described

the other hand one can take hold of the nails just below the handler, draw out the handler and the operator is ready to resume nating

#### A Wheel That Floats the Load

A NEW development in resilient wheels is constructed along entirely original It is claimed to posse

commonly used The axle is "floated" on a series of rubber cushions which radiate from the hub, distributing the pressure in all directions. There is no contact between the hub and the t except through these cushions. The cushions above and at the sides of the hub bear the weight and shocks equally with e underneath—a feature perhaps never

before possessed by any resilient wheel.

These rubber cushions respond to shock loads almost instantly, with very little rocoid, and will efficiently absorb shocks of widely varying intensities. Thus at due to the ample volume of soft reditent rubber which is exposed to the status at all times. The computing sides. resitent rubber which is exposed to the strans at all times. The opposite sides of these round cushions act as shock absorbers and neutralise practically all recoil. The cushioning effect is many times as great as that of the ordinary solid tire which is limited in its resiliency to the small portion of rubber acting at one time, and which encourages rather than controls rebound

The ability of this wheel to absorb Ane source or this wheel to absorb all radial, torque and side thrust shocks is obtained by each cushion being sup-ported throughout its entire cricum-ference, so that strains may be uniformly distributed over as much rubber as possible Inasmuch as there is no motion between any of the surfaces in contact, there can be no abrasion or wear

## Concrete Corn Crib to Keep Out Rate

IN England where the scarcity of food has been brought home to the people more than to the Americans, there is a law against having rate in the cornerib, and a heavy penalty is imposed on any farmer who allows rate in his storage.

against having rate in the cornerib, and a heavy possibly is imposed on any farmer who allows rate in his storage. Until connecte came into use in the country it was a hard job to keep the country it was a hard job to keep the corn of the country it was a hard job to keep the corn. The up-to-date farmer is using concrete more and more for building. Its lasting qualities are one big thing in its favor and in the case of protection against rate, it is about the only protected building material b effective way of fighting rate

stopped going to school. The worker is more and more recognizing that this is not true. This accounts for the surprising increase in correspondence schools, which have done a stupendous good, especially in

Buyde racks and garages with an air compression are almost a necessity today, and help to bring the worker shome nearer

& Reduction in labor turnover on a systematic bans has been much fostered grat mate bane has been much fostered during the war when organizations everywhere were short of workers. It has its advantage also when workers are plentfull. The hardships to workers and their families due to irregular employment and the effect on the community of their lessenced earnings and preducivity are now generally appreciated. The shifting of apparent much to other pole in the same organizations has revealed that the management has in the past been as much at fault as has the worker himself in causing halp labor turnover.

fault as has the worker himself in causing high labor turnous benefit soosities excitatively for employees have proved that causely for employees have proved that the provide a most satisfactory opportunity for satung the worker who has committed an act that has injured has sellow workers to contribute a gift to the society instead of discharging him. The old-that has been sellow workers to contribute a gift to the society instead of discharging him. The old-that has been sellowed by the society instead of the shallow of heavy to contribute and a kinds with the shallow of heavy cohorastion and a kinds. abor turnover

Laboratories for research in best methods have demonstrated that larger outputs with less fatigue can be obtained to a surprising degree—It is not unusual at all to find that triple outputs and cause no more, and often less fatigue

With the aid of motion picture cam we are now able to record for all time the methods of the most skilled We can methods of the most skilled. We can now present these pictures not merely as motion pictures—for that is their least important use-we can project them as important use—we can project them as const utive lantern slides, examine each pi ture and see the motions and the recorded elapsed time of the motions of

the different methods For the first time in the experience of the world we now have perpetual cumulative improvement in industrial methods in form for 11 stantaneous presentation to learners, exp rts and teachers. Not only does this teach the best way known, but the manner in which it teaches reduces the time of the learning process
This has been demonstrated time upo

ness mas toen demonstrated time upon time in the industries. The General Staff of our Army has already recognised this fact and used this method for teaching the entire army of officers and men the one best way, with most satisfactory re-sults

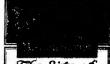

suits

Now all these 17 items here issted, as
has been said furnish a basis on which the
workers and the employers can continuously cooperate They furnish as
opportunity for getting the habit of cooperating Both workers and employers
help themselves as well as sech other by

help themselves as well as each other by systematism; these 17 subjects even during disagreements and the most heated differences on other subjects. There is another feature Such co-operation will result in increased outputs But are increased outputs desirable! Well, the public undoubtedly wants increased outputs because they enable it to buy cheaper. The employers also want increased outputs because they can thereby

mercased outputs because they can thereby get lower costs. Do the workers want sucressed outputs? They surely should, for only by increased outputs are seen peter with foreign countries. Before the war the workers of nearly all countries believed that manil output reasulted to their beselft on the theory that it results in giving employment to more people. The new workers, many of them but sem-skilled, have broken all goodneties meantly.

Now the soldiers are coming back in all comtrine. They want their ald who

This list is varied enough to mediately This list is varied enough to provide ample opportunity for employers and employees to make a big start on cooperation even where they have in the past believed that their interests were

opposed
The slogan must be America for cooperation and maximum productions

#### Airplanes for the Transatlantic Flight

(Continued f om page 202)

The Handley-Page four engined biplane The Handley-Page four engined biptane with a pair of pontoons or some other form of marne chassis in place of its land chassis should be available for the translatantic oresum I in fact it is generally understood that the Handley-Page organ isation is making hurried preparations for an attempt. The largest Handley Pages with a spread of over 125 feet and a

Pages with a spread of over 125 feet and a carrying capacity of 40 passengers could be modified for long-distance travel by substituting fuel for passenger space. Last-minute advices tell of a British super-triplene which is claimed to be the largest machine in exustance now marking completion it is expected to make its free flight under Capatain Dunn at an early date Its capacity is enormous and al-though the inside fuel tanks limit the num ber of passengers to 50 future machines with outside tanks should be capable of

oer of passengers to of future monutes with nutside tanks should be expable of second models and the passenger of the passeng

## No More Roof Troubles

NOW-you can cover or re cover your roofs and forget them for ten years

Simply coat them with either liquid or plastic Stormking They will be made absolutely water tight and stormtight by this Asbestic Asphaltic Compound which neither runs or cracks under extremes of heat or cold

## Small Initial Expense—No Repairs

Ordinary roofings require constant and costly repairs

Stormking is not only mexpensive but it needs no repairs or re painting for ten years and we so guarantee it

Ordinary labor can brush or trowel on Stormking so you again are saved both wages and delays Apply the liquid Stormking over gravel rubber type or corrugated iron surfaces Apply plastic Stormking to all other surfaces whatever especially recommended for repairing badly worn roofings

If you have an old roof to repair or a new roof to cover write Dept B for facts costs and testimonials concerning Stormking and tell us what kind of a roof you have.

#### MODELS BUILT AND INVENTIONS DEVELOPED

We are prepared to build special ma hinery and models from most delicate pre-cision instruments up to 10 ton machines ENGINEERING AND PLANNING DEPT

Best Bouspped Plant of sie kund in Country THREE RIVERS MACH TOOL & DIE CORP., PHOENIX, N Y

Fire German machine is reported to great fatteress from their ordinary us have a wing presed of 166 feet and stands all these things crosses conditions we more than 26 feet high. It has six motors, turn the whole industry of a nation agreed to total 1,800 hove-power, driving down, and throw its markets into two iractor sorows and two propellers willook confusions. Each air screw has four blades It is said ason an acrew has four blades it is said that two motors are sufficient to keep the machine in the air, hence the Germans too are taking no chances with engine failure and mefortune The reports la stress on the navigating devices, particu-larly the drift indicators, which make the let of its pilots far more certain than

The French and Italians are not believed The French and Italians are not believed to be ready for the attempt. The French have not developed super-airplanes to any great extent and while the Italians have bug machin so in the form of their Caproni triplanes it is understood that they have nothing ready for the moment
So in sum the transatiantic flight

promises to become a fast accomple within the next few months. More than one sirplane is ready, not counting the large dirigibles of Great Britain and Germany which are also available for the journey, and if anything, present a more sultable means of travel than the airplane

#### Every Man's Airplane—A Big Step Toward Aerial Transportation

(Continued from page \$02)

struts to be folded into the fuselage dur ing flight with a resultant reduction of head resistance. Indeed it is said that the speed is increased some 11 or 12 per cent by the retractable chassis

Tie dimensions of the machine are ex-tremely small the total span being under 18 feet. The claim is made that the machine can comfortably start or land on any country road which from the acrual commuter's viewpoint makes the machine practical since a large flying field is unpractical since a large flying field is un-necessary. The overall length of the maximue is 13 feet 4 mohes and its height 7 feet 4 mohes. The total area of the wings is 100 feet and the total weight 350

wings is 100 feet and the total weight 350 pounds in lidding signine. At the present writing no figures are 4x the present writing no figures are yet available concerning the actual performance of the machine but the estimate of 135 miles an hour at ground level, 112 miles an hour at 10,000 feet and 97 miles an hour at 10,000 feet and 97 miles an hour at 25 000 feet. In his opinion whin fitted with a 60-brare-power engine, the speed at 10 000 feet would be 145 miles are hour lists are to 100 miles are hour 100 feet. mile

Returning to the engine, we find that it is an air-cooled two-cylinder opposed "Gnat" A B C type which develops 45 horse-A B ( type which develops \$6 horse-power at 1915 revolutions per minute 12 he fuel consumption is said to be 0.56 pound per horse-power per hour, the total weight of the engine being 50 4 pound he hould have the land in placed in the upper main plane above the fussinger, and has a capacity of mee gallons or a sufficient supply for a two-hour flight. The mount-ine of the horsent supply for a two-hour flight. ing of the horizontally opposed engine in the nose of the machine and the hemispherical pot on the airscrew boss gives the maa very neat appearance, and, although it cannot claim to possess the beautiful lines found in many modern airplanes it is full of useful and original ideas. The machine will probably sell for shout \$2,000

#### The Labyrinth of Chemistry

(Continued from page 208) for Germany to develop the fixation of

for termany to develop the fixation of atmosphers natrogen.

This chart shows well the disturbance provoked in the chemical industry of a country by the necessity for producing large quantities of munitions it is necessary to build not only factories for explosives but also for sulfuric and nature.

scide it is necessary not only to produc dynamite and guncotton, but soap and candles and bensene. The abnormal consumption of certain raw materials, often necessitating embargoes against their normal uses the extraordinary production of certain by-products, the diversion of

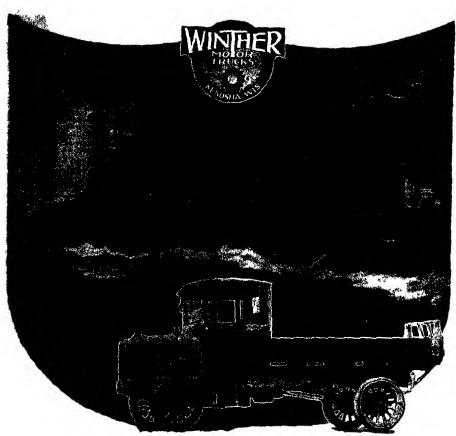

If the chemistry of expl plicated and far reaching, what sh pleased and far resolting, what shall we say of the processes of preparation of the thousands of dyes and other chemicals of the synthetic organic industry. No client on any such model as we have used could possibly be prepared to cover the faild, the attampt would only leed to contastion worse confounded. Even with the most complete knowledge, the close interdependence between all parts of the field often prevents effective production. Thus the methods of preparing most of the German dyes are very well known to our chemists. But mose files than not they German dyes are very well known to our chemists, but more often than not they manned secure all the proper intermediates, and the lack of one such substance will frequently prevent the manufacture of 20 others. And when a new product as to be made in face of the fact that all the sulfure and mitro plants have sold their suffered manufacture and mitro plants have sold their suffered manufacture and mitro plants have sold their entire outputs many months in advance to

the munitions works, the problem becomes impossible of complete solution Let us remember in trying to appreciate the difficulties that 90 per cent of the enormous production of German dyes is monopolised by five companies, which for half a century have been continually improving their methods, which produce themselves all the chemicals they need themselves all the chemicals they need and whole are financially powerful enough to crush out by runous underselling, any stempt at melependent production of important intermediates from many it would be wholly them shifts octabilish a new dye factory. Consequently when forman trade with the tribute was cut off, and with it the Grand trade was cut off, and with it the Grand trade and the contract of the contrac generally, interiors commercian and no exacting organisation to build upon—they had rather to go back to the very beginnings and duplicate on a smaller scale the whole tremendous German system before they could show adequate results. Under the

Fvon in industries where the raw ma-terials are simply modified without any aynthesis, chemical interdependence reaches a point unsuspected by the layman. For example, take the rubber industry. To make rubber resist changes of temperature it is vulcanized with sulfur and antimony it is vulcabled with sulur and antimony compounds, to reduce costs, dilution is re-sorted to with substances made from various oils, to make possible a thin coating of rubber, it is dissolved in a quancoating of ruoser, a scassored in a quan-tity of different substances, for the numer-ous uses it is necessary to add pigments, fabries, etc. We reproduce a most in-luminating graphical representation of the ramifications of the chemistry of rubber,

ramifications of the chemistry of rubber, gotten up by Brunok and by him christened the rubber tree "And so it goes in all branches of chemistry When, instead of mixing a samelers of the control of the products of the mixture, it is a matter of extracting everal intermediates or fluibbed products of the mixture, it is a matter of extracting everal intermediates or fluibbed products inversal intermediates or finished produces from one natural source, the interdependence of these products is absolute. It is only recently, after years of patient research, that a practicable method has been devised for extracting from entude petroleum more gaedine than it could gave formerly. Perhaps the time will count when it will petroleum, an abnormally high percentage of parsifin or bessel, seconding to marking or parsifin or bessel, seconding to marking or parsifin or bessel, seconding to marking the performance of parsifin or bessel, seconding to marking the percentage of parsifin or bessel, seconding to marking the performance of parsifin or bessel, seconding to marking the performance of the perf far from that To get a given amount of gasoline we must breat down a given amount of the raw oil; and in doing this we must, whether we like it or not, produce a given amount of every other petroleum derivative

All modern industries are more or less interdependent But the chemical in-dustries are on the ultimate pinnacle of interdependence.

# A Service of Which We Are Proud

THE "Before" photograph above shows a section of West Michigan Pike, Van Buren County, Michigan, as it looked in the summer of 1916

But the taxpayers of Van Buren County realized that such roads as this not only hampered the development of the county and made travel difficult, but that in the long run they cost the community more than good easy-traction roads

The "After" picture shows the same road, photographed at exactly the same spot, after macadamizing and treating with "Tarvia-B."

West Michigan Pike is now a firm, mudless, dustless road, water-proof and automobile proof, over which full loads can be hauled to market with speed and economy.

And wisely, the taxpayers of Van Buren County propose to keep this road

new. Last year they gave it a second treatment with "Tarvia-B". Thus at very small expense they protected their original investment and now have a fine piece of highway that brings their markets at South Haven and Watervliet miles nearer to each other.

The satisfaction felt over the vast improvement effected by the use of Tarvia is officially expressed in the following letter from the engineer of the Van Buren County Road Commissioners, Paw Paw, Michigan:

"The Van Buren County Road Commission has been using "Tarvia-B" for some years to maintain about 20 miles of macadam road and it has given the greatest satisfaction. We have entirely got rid of dust and ravelling and it is the opinion of many observers that the roads get better instead of worse. This year we had about two miles of macadam which was so bad that the State Highway Department advised covering it with gravel, but instead we patched the holes with Tarvia-KP (which by the way is something that is indispensable in our business) and total with the state of the Tarvia-B" and stone chips and today the road is in better shape than when new. We also have been trying out

"Tarvia-B' on a trunk line gravel road, the gravel testing about 15% stone. The results have been very good in spite of the heavy traffic. It produces a smooth, durable sarrier which will be better the second and third year than the first. We are now building a 30,000 gallon storage tank so that we can always have a supply on hand when we want it.

"Aside from treating the roads with 'Tarvia-B' there is no maintenance cost but a little attention to holes and drainage.

"Tarvia has solved our macadam road troubles

"Dans P. Smith, County Road Engineer."

Now that the war is over, the Nation needs more roads of this character properly maintained, because the public highways offer the only means of helping out the railroads and aiding our transportation facilities.

The use of Tarvia will give any community or state all-the-year-round roads that are dustless in summer, mudless in spring and fall, frost-proof in winter, and that are easy to maintain at a low cost.

Illustrated booklet describing the various Tarvia treatments free on request.

III N we were informed that a rider had been attached to the Agricultural Assessment Bill stored to kill the Daylight Saving Act we experienced a distinct shock. It did not seem possible after having thoroughly tested out the benefits of day light saving last year that suyone could be so reactionary as to wish to return to the former condition of wasted morning light. When we harned that the opposition to daylight saving was mairly due to the farmers our astonishment grew apace We had always looked upon the farmer as one who delighted in early hours and who would love to have the rest of the world routed out of bed with the sun. And a in our perplexity we hunted up a farmer friend and be sought him for an explanation His reply was surprising to say the least He informed us that farmers re illy prefer the afternoon to the morning for work in the fields. They do rise early to be sure but the early morning work is taken up with chores Much of the field work cannot be done until after the dew is off the ground. For instance, hay cannot be cut while it is wet with dow the farmer must wait until the sun has dried off the moisture. Weeding also is done better when the score hing sun is high and when the weeds will withor immediately upon being nulled out of the Weeds that are wet with dew may actually take root again unless they are promptly withered by the sun I ast year farmers had difficulty with hired men who insisted on quitting work according to the new summer time, thereby cutting off an hour from the afternoon labors in the field. And strange to say the cattle did not take kindly to the new hour The cows stubbornly refused to come home when the sun was high In the skirs, and as hired hands refused to wait upon the whims of the cow the farmer was in a quandary indeed

However, the advantages of daylight saving to the rest of the country are so marked that we cannot possibly wish to go back to the old time schedule, even if it may inconvenience the farmer to some extent. Not only did the general public find it much pleasanter to rise earlier and have more daylight lessure time after working hours but there was an actual saving in lighting bills and consequently a saving of coal which we cannot afford to proore

any time schedule that is not based on the setting of the No doubt they would love to have us use the Turkish plan of setting our clocks to 12 cach day at the boom of the sunset gun

But we may reassure the farmer that conditions this year will not it so bad as they were last year for with our boys a turning from the other side and with many hands idle during the reconstruction period it will not be so difficult for him to obtain labor which will be willing to adapt itself to the conditions which the farmer

By all means, let us continue to save daylight

#### The Declining Supply of Motor Fuel

T I is almost superfluous to call attention to the ever increasing demand for gasoline every motorist has it brought vividly before him every time he stops at a service station It may not be generally realized, however that the consumption of liquid fuel is now proceeding at such a rate that an estimate can actually be made as to when exhaustion will be attained if there is no impi ment in supply or in use As our knowledge of our underground resources becomes more accurate it becomes correspondingly possible to reduce the margin of error in what once were more scientific guesses so that today we cannot afford to scoff at the technical man who tells us that there is in the United States a mere 61/2 billion barries of petroleum underground. The annual consumption at present exceeds one third billion barrels and it requires no extraordinary mathematical ability to divide 61/2 by 3 and get a quotant of 1914 Less than 20 years supply in sight if present practice is main taunc d

I oday we get back about 20 per cent of our crude oil in the form of gasoline. This percentage can of course be increased but not without mercasing the cost. Not must we forget that the stock remaining in the ground becomes heavier all the time, so that the vield of gasoline is bound to decline from this reason until finally we shall be able to extract but 21/2 per cent of gasoline from the crude product of our oil wells. The blending of highvolatile gasoline from natural gas with low-volatile gasoline from petroleum (an be carried out obviously only so long as we have the high viatile material to use in this way. This with equal obviousness will not be for long nor can we, even now g t any great quantity of high grade fuel in this was

By lowering the volatility of the gasoline, through the use of a larger percentage of the volatile petroleum the supply of engine fuel can be mercased but not indefinitely nor without disadvantage. In particular when we get fuel standards down to a point at which existing engines balk, what are we to with the millions of existing engines? Substitute fuels such as benzol alcohol etc may well be considered, but their price would necessarily be greater than that of gasoline today Nor would it be possible to manufa ture many of them on any scale without a complete overturning of a wide i dustrial field. The degree of interdependence existing in the very nature of things among the various trades using and manufacturing chemicals has been sufficiently emphasized by our wartime troubles with potash and nitrates and dyes I inally as we expect to show in an early issue, the oil shale deposits upon which so much reliance is placed for an extension of the gasoline supply to an indefinite period are not going to be of such immediate or such wide effect as the public has been allowed to suppose

tively decline, and the price will positively soar burden falls upon the engine It must adapt itself to less volatile fuel, and it must be made to burn fuel with less waste. To accomplish these results is the task before the automotive engineers who must turn their thoughts away from questions of speed and weight per horse-power and comfort and endurance, to avert what in the absence of effective attack will turn out to be a calamity seriously disorganizing an indispensable system of transportation

#### Coal-Black, White, Green and Blue

OST of us are familiar with the use of the term white coal to designate the power derived from streams In Europe a distinction is made between white and green coal Only the power derived from melting glaciers and snow caps is known as white coal, while other water powers are termed But there is another vast source of power, namely, that which may be derived from the waves and tides of the ocean, and this is now termed "blue coal

In a recent issue of the SCIENTIFIC AMERICAN we disussed the world a visible supply of black coal and showed that at estimated future rates of consumption, it could not last more than fifteen hundred years furnishes a virtually perpetual supply of power, but the quantity is limited If we used all the available water power of this country, it would yield about sixty million horse-power, according to estimates of the U S Geological Survey But much of this would not be commercially available as it represents the entire fall of all our streams Forty millions is a more conservative estimate and this is the equivalent of three hundred million tons of coal Vast as this total may seem, it would not begin to meet even our present needs, for we are consuming today about five hundred million tons of coal. In time we shall be compelled to supplement our hydraulic powers with other stores of energy

Blue coal, by far the greatest store of energy on earth has as yet been practically untouched. There are cnormous difficulties in the way of harnessing the ocean It is so irascible and when angered its fury is so violent that as yet no man-made wave-power plants have been able to stand up against its wild assaults

But we are growing more powerful every day Enguttering projects are being undertaken which only a few years ago would have been thought impossible The time may come when even the ocean temp obey the will of man and turn its energies to useful work More immediate however, are the prospects of using the power of ocean tides. The subject is discussed at length in the current Supplement So far, such little power as has been abstracted from ocean tides has been insignificant The rise and fall of the tides is not very great, even though it does amount to sevenly feet in some few places, and hence, if any considerable power is to be obtained, basins of large area must be used By damming the bay of Mont St Mithil in France, where the tide rises about forty-five feet it is estimated that enough power may be obtained to operate half of the industries of France A French engineer with vast powers of imagination has conceived of building dikes across the channel and across the Phames estuary to form two large tidal basins which may be used alternately to furnish a continuous supply of power. An ambitious plan, to say the least, but history teaches us that the visionary scheme of today often turns out to be the practical commercial auterprise of tomorrow

#### Papers for the Soldiers

HE various official and semi-official bodies which are concerned with the supply of reading matter for the Army have with complete unanimity written to call our attention to the fact that at this time, when magazines are needed more than ever, the SCIENTIFIC AMERICAN is not reaching the soldiers in sufficient quantities, and the reason for this is pointed

When we changed our dress at the beginning of the year, we searched in vain for a place on our redrawn and smaller cover where the so-called "Burleson notice would look well We did not find such a place, and not realizing that the omission of the notice meant anything more than cossation in reminding our readers of something which they now know by heart, we decided to leave it off But it appears that in the absence of the notice, the nost offices refuse to forward copies of the paper mailed at the one-cent rate, and that there is accordingly a famine of SCIENTIFIC AMERICANS at the camps and hospitals here and abroad

The SCIENTIFIC AMERICAN IS IN very great demand among the soldiers, and even normally it is difficult to make the copies received at the various army establishments go around We are rather proud of the outery that the Army has set up to have the missing notice restored, so that the SCIENTIFIC AMERICAN will come again to the soldiers, and we should be very happy indeed to restore it, even if it looked far worse than it does We urge all our readers who can by any possibility get along without the file of back numbers to avail themselves of the Burleson privilege and help supply the soldiers with SCIENTIFIC AMBRICANS

#### Publication Work of the Department of Commerce

THE Department of Commerce issued during the past fiscal year 1,141 daily, weekly, monthly, quarterly, annual, and special reports, the printing of which cost \$300,000 These publications contained a total 42,844 printed pages, and there were printed of them a total of 4,804,180 copies

The free distribution of many of these publications hmited to well-defined public classes. This policy is limited to well-defined public classes as resulted in a reduction of wasteful distribution statement issued by the Commerce Department sho that the Superintendent of Documents received \$32,993 during the year from the sales of copies of its publicstions In addition to the sales by the Superintendent of Documents, the Coast and Geodetic Survey received during the year \$20,194 19 for copies of Coast Pilots, Tide Tables, and Charts

#### Industrial Efficiency

Faver Accidents Now and Why War conditions, by branging large numbers of new and unakilided workers into industry, had in general the effect of increasing considerably the number of industrial accidents, both setually and relatively to the number of persons engaged in certain industries. Information recently received by the Inspection and Invastigation Service, Department of Labor, indicates, however that in general the number of such souddness has now returned to approximately normal figures. In a comparatively short time before the cutanos of America into the war, the effect of workmen a compensation laws and safety work had reduced the number of industrial accidents almost 50 per cent. The temporary increase due to the influx of war workers has now vanabled.

Big Forestry Scheme for France —Norway intends to help out the restoration of the deviated part of France, in the front sone, by planting a belt of Norsching forest trees — Much cithusiasm has developed for the scheine, and it is intended to begin work this spring. It comprises the planting of 250 acres annually party of about 50 Norwegains in streaming into Cousul Hubberg, at Christiania. The idea is to send a forestry party of about 50 Norwegains fully quiping with trees tools, tents, and stores so as not to impose the slightest burden on Prance. The tinature sone for planting the belt of trees is from Adreuiues toward the Belgium formetr, behind Arras, where there formerly was fine forest, but action will be taken in accordance with the designes of the French.

Nonacknowledgement of Orders by American Pirras.—The attention of the Monteroy (Mexico) Consulate has been called to the difficulty that local firms are experiencing in securing schoolwedgements of orders sent by them to the United States. This is a condition which was prevalent prior to the war, but with the added difficulties of trade incident to present conditions, the situation has been very much intensated it appears that firms here send orders to the United States and get no replies for everal week or months, and is some oases numerous telegrams are sent without any replies being received. Frankly this is not the way to handle foreign trade. Such methods may yet cause American firms to lose much of the overseas business that has falle into the hand during the period of the

Dend Sea Bitumen -lt is not generally known that ample quantities of bitumen occur in the Dead bea region It can easily be gathered and prepared for use in road making, and there is the advantage that it will be obtainable at much cheaper rates than those which now obtain in the Near Fast and in Lurope The material can best be applied by means of the usual tar-spraying machine Dead Sca bitumen was undoubtedly used in It is evident that the walls of the temples anment times and palaces of Babylon and Nineveh were joined with bituminous cements, and there are bituminous cisterns in Syria of great antiquity which are still watertight and fit for use A road surface treated with this asphalt according to modern methods may prove a most satisfactory solution of a very troublesome problem in the Near East, where, because of climatic conditions and the narrow wheels of vehicles, the macadam road is often a source of trouble, owing to the dust that rises from it

Safety Engineering -Safety work will be introduced in the curriculum of every technical school in the country, if possible, by the Working Conditions Service of the Department of Labor, as a means of promoting its plans for safety in industry. It is not planned to introduce special courses on safety work, but rather to inculcate principles of safety in connection with the usual instruction in engineering courses. The prevention of industrial accidents will mean a great economic gain to the Nation, for the annual loss in labor power is tremendous Recently figures were given to show that 200,000 industrial accidents occur each year in Pennsylvania alone, these accidents including only those which required absence from work. The training of technical men in such a way as to keep safety principles before them in their work in factories, engineering projects, mines, and the like will be an important factor, it is expected, in reducing the present heavy drain on industry from accidents

#### Science

Fire-Retarding Paints—From tests made at the Bursan of Standards it appears that while practically all paint contings have some line-ri-triding action none of those of far tested afford very grit projection. All the samples in question were materially damaged by application of fishing for a few sconds. Both sodium sitiation of shine for a few sconds. Both sodium sitiation and whiteweak rank comparatively high. These have the advantage of sheapness and an both he used on the advantage of sheapness and an both he used on the advantage of sheapness and in both he used on the order of the same surface. However work in the internal projection and the use of such materials shi did not be made an occuse for omitting any of the usual precautions.

Magnetic Analysis of Steel - 1 hr 1 5 Bureau of Standards has been engaged for a me years in developing methods and apparatus for using the magnetic properties of materials as an in hit tion of their quality and mechanical properties. A f ribcoming paper deals with the magnetic properties which might serve as criteria for the estimation of the much much fitness of steel describes magnetic methels of testing and dis cusses the relation between heat treatment of highcarbon steel and its magnetic projectics. The Bureau has applied the method of magnetic analysis to the testing of rifle-barrel steel hall bearing races and steel These investigations are of especial interest in view of the recent development of the permeameter for working the measurements which the Bureau is now learning to translate into the or livery terms of physical properties

Wild Life Reservations in Michigan -Mr and Mrs E K Warren, of Three Oaks Mich have just set aside as wild life preserves two tracts of land in Michigan One is an area of 300 acres mear three Oaks consisting partly of virgin forest of beech and maple the other of 250 acres, is in the sand dune region on the shore of Lake Michigan, north of Sawyer Bernen County preserves are incorporated in the I dward K Warren Foundation which also includes the Chamberlain Memorial Museum at Three Oaks opened in 1916 Both tracts have been set aside so that future generations may have an example of the primitive floral and faunal conditions of Southern Michigan and as a place for carrying out various studies in natural history The University of Michigan has been asked to make a detailed survey of the reservations and it is plauned to extend this survey over an indefinite number of years Field laboratories will be provided for this purpos by the Foundation

Studying Sound at the Bureau of Standards -A new branch of the U S Burcan of Standards the Section of Sound Investigation was organized in August. 1917, and has acquired a first rate equipment including the Lest types of instruments for determining the three distinguishing features of sounds vir, pitch intensity and quality It has also a good assortment of sources of sound and standards of comparison. While the section has devoted much of its time to military problems, including studies in sound-ranging etc. the apparatus acquired is practically all of it of permanent value for investigations of a general character. The Bureau has installed a Koenig clock fork the most refined instrument vet constructed for the exact measurement of vibration frequencies of tuning forks. A Webster phonometer of the latest type, for measuring would intensity has been constructed for the us of th Bureau under the personal direction of Prof Webster of Clark Um versity, Worcester, Mass. The Burcau has also see ired an audion, as used in radiotelography and a vrge collection of tuming forks, including a unique and valuable set of 37 forks covering the range from '23 to 4,186 vibrations per second by semitones specially made for the Bureau by a Chicago manufacturer At the Bureau itself has been developed a set of Reed phonometers," similar in principle to Webster's phonometer but very much simplified and used in considerable numbers, so as to give data for a number of pitches at once instead of only one For rapid but less accurate determination of the quality of a sound a simplified form of "phonodaik" has been devised Both the Reed phonometer and the phonodesk have been used in testing the efficiency of several types of muffler for gasoline engines used in aviation.

#### Automobile

Although the regular suplane, cupin apparently boson on place in the automobile field, the experience, with some place in the automobile field, the experience, with some place in Finding One (spe. 2) in 30 to that has been exceededly developed above the some interesting perposals in Finding One (spe. 2) in 30 to that has been exceededly developed above the standard engine, in which the vibrates as the radially around a common crash cose, it fixed and the erank shaftly driven in the regular way. Several Burtish manner facturers are proposing to build moderate powered engines of this type, specially designed and built for use in light cars. One of these is described as having five air could within the surface of the su

A Starting I rouble - As time I issue and gasoline" gets po rea difficulties in starting the engine increase Of course a large percentage of motor cars are equipped with electric starting devices still it is not a reasonable proceeding to everwork an expensive battery to offset defective conditions. We cannot control the quality of our motor i icl so it behooves us to give closer attention to the mechanical details that are apt to cause difficult starting. One of these which often gives a great deal of trouble because it is particularly clusive in its symptoms is a leaking joint in an intake manifold One of the commonest indications of this defect-that manifests itself after the engine has finally consented to start -is a sputtering that sometimes casts suspicion on the iguition and then on the carbureter and these manifestations are not always continuous but decidedly spasmeds Then it is well to go slow on adjustments, and look for looking joints and sticking valves

"After the War" Engines - there has been much talk about the wonderful engines that are to appear after the war but as has been noted, there is little likelihood that anything embodying notable changes will be seen for some months to come for the reason that manufacturers have been too busy in other directions to develop ucw designs and present models have stood the most exhaustive tests in the strenuous war work OVER there which would not indicate any very great necessity for a change just now "till evolution of the internal combustion motor may be expected to continue in its natural course and not a few engineers have dreams of future engines of wonderful economy and efficiency At a meeting of automobile engineers not long ago one of them said The internal combustion engine is understood in general but in fuel and efficiency problems special attention most be focused on it. Our engines are We must design engines that will use fuel not efficient more economically and not throw away 46 per cent of its thermal efficiency through the water jackets and 30 per cont through the exhaust as is done today greatly interest many of us to have some definite suggestions as to how these things are to be effected

Airpiane Engines in Automobiles A great many people are telling how the stock of airplane engines that has accumulated during the war can be utilized for pleasure cars but their suggestions disclose a decided lack of knowledge of the characteristics of the motors in question There are a great many reasons why such a use of these engines is not practical, but only a few of them will be meutioned here A very desirable feature m an automobile engine is flexibility which is practically non existant in the surplane type. It is true the automobile is equipped with change gears but few people even the most cuthusiastic would care to run a very powerful motor at full speed all the time. Then again the airplane engine is very lightly and delicately built and it is expected and usually necessary to carefully overhand and adjust after every trip and no amateur, and very few garage mechanics are competent to perform this work | The p ried of their maximum efficiency is also very limited Moreover the exceedingly light construction of the flying engine makes it inevitable that it would fail at many points and in a very short time as a result of the jolting it would be subjected to in a car As a last reason even the smallest engine would be altogether too powerful for the suggested work, and the man who took one of them out on a public highway ought to be indicted on sight, as there is no reasonable occasion for an engine of from 100 to 400 horse-power and a car with such a motor would be a menace to the community

#### The Proposed Vehicular Tunnel Under the Hudson River A Study in Ventilation

THE Hudson River is at once a valuable asset and a serious handless to the city of New York. It provides at unexcelled waterway up the entire length of Minhattan bland and at the same time its depth and trial expanse make. ir al expanse make : difficult river to span with imiges | 1 xeept for ti three railroad tunnels that have been jushed through its helt the only means of travel letwen the metropolis and cities on the lerses shore is by ferry. The inadequity of this means of com-munication was clearly demonstrated during the war

and the reent ferry strike emphasized the importance of stablishing a road way either above or below the river which could be used by trucks or pas

senger vehicles Our ferries have not sufficient (a pacity to accommodate the wheeled traffic that plies between New York and Jersey City On almost any after noun long lines of motor trucks and nassenger cars may be seen waiting their turn to get stand Frequently a car must await the loading of three or more ferries be-fore room will be found for it to lie taken aboard Clearly sumething should be done and done at once

Eighteen months ago a letter was pub lished in the carreished in the correspondence mage of the Settentific American severely criticiang a proposed vehicular tunnel under the Hudson River on the ground adequate ventila tim It was shown that the exhaust gasses of an arte ir ld minim a silerable quantities

t art on monoxide a most insidious and deadly posson which is injurious even wher present in quantities of six r seven parts of fair and the cor that to dilute the gases sufficiently to meure the safety through the tunnel u der normal traffic auditions would 45 000 horse power for the ventilation

evetem slove and at an annual cost of \$50 per horse power this would amount to \$2,400,000!

Although we do not hold ourselves responsible for statements made in the correspondence page nevertheless the conclusions reached in this communication were of so startling a nature that we checked up very carefull the data on which the argument was based and could find no serious flaw in it. A cordingly the criticism received our unqualified support and we supply mented the letter with an editorial vigorously condemning the construction of this tunnel for motor vehicle traffic

But our criticism applied only to the particular tunnel then prominently before the public and it must be re-vised considerably when dealing with the tunnel recom-mended by General George W. Goethals in his capacity of consulting engineer for the New York State Bridge and Tunnel Commission The former tunnel was elliptical in cross-section with a horizontal diameter of 1234 feet and a vertical diameter of 2234 feet. There was no division between east and west traffic and no means of making the sir currents flow in the direction of

accompanying views show it in longitudinal and cross-section. It consists of a tube 42 feet in diameter, built of pre-east concrete blocks, three feet thick, so that the inside diameter of the tube is 36 feet. A central horisontal diaphragm separates the tunnel into a lower west bound and an upper east bound roadway roadways are 24 feet 6 inches wide and with 13 roadway are 24 feet 6 inches wide and with 13 feet of head room they provide room for three line of traffic on each roadway. Slow horse-drawn trucks must keep to the right, motor trucks must hold the center line and slight proof passing and the create the contract of the create the cre

way the capacity is increased nine fold over the capacity of a tunnel with but one line of traffic

Although a 42-foot bore calls for a much larger pneu-matic shield than has ever before been used in tunnel work there are no apparent engineering difficulties in the way of its success The use of concrete blocks in place of a cost iron lining is somewhat unusual but it is not an untried experiment The Mount Royal tunnel at Montreal was built of such blocks, with perfect success From a tunnel engineers point of view the plans are feasible plans are feasible. The only problem is that of ventilation. Can the tunnel be cleared of poisonous gasses without running into prohibitive figures for the installation and mantanance of an adetenance of an ade-quate ventila-tion plant? We have consulted an experienced ventils. tion engineer and he samures us that it is perfectly feasible Above the roof of the upper deck and the aids walls of the two decks are large ventilation ducts Since our outs were made the design of the tunnel modified and modified and the horisontal partition beyond the side walls (as shown in

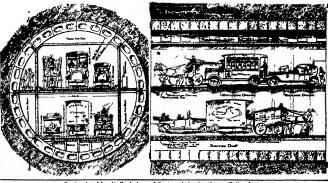

the sectional view)

ated maken total cross-se

are to take ears of the carbon dioxids.

According to the original letter published in the Schwarzic America, an authority was quoted for the statement that six, an authority was quoted for the statement that six, and the statement has six parts of CO in 10,000 brings on sufficient in 10 miles. The statement was six miles by disting the carbon monoxide to 6.5 parts in 10 0,000 stubie feet of CO must be missed with 400,000 subie feet of coll nuts to missed with 400,000 subie feet of coll nuts to missed with 400,000 subie feet of coll nuts to missed with 400,000 subie feet of coll nuts to missed with 400,000 subie feet of coll nuts to missed with 400,000 subie feet of coll nuts to missed with 400,000 subie feet of collection of collecti

sour would amount to its moderate sum of soulous. Treasty-ser changes of air per hour represents a various active are discussed. The air move in the direction of the control of the contr

custom team and towerso.

Ventilation engineering is a very eract science and apparently there is no reason why a traffic tuned may not be built in which pure air may be maintained provided the matter is given adequate consideration by experienced ventilation engineers.

Raiph De Palma and the car with which he made a speed of close to 150 miles per hour

#### 150 Miles Per Hour on Wheels

IT was only a short time ago that we could rescrebly be believe our cyes when we read that an automobile had made a speed of 120 miles per hour or a mile in half a minute Since then, mile re or its have been successively amashed With the advist of the airplane we grew quite accustomed to think of travel at speeds of 125 to 130 miles per hour and so whose we learned that Ralph de Parkms, record, at Ormonic Beach on twee not half as actuathed as we re tilly should have been This figures out to nearly 150 miles per hour, or 140 8, to be exact Few surplanes have made as high a speed as this against the air To be sure with a following wind to help these, they have ex ceded this speed as an anaessured over ground, but 150 miles per hour without the ski of drift is an exceedingly high velocity and it as a speed on wheels at on wing. The car with which the record was amashed has a twin six aviation engine power plant. The former record for it for mile remanes, Ralph de Falms made some other interesting records. The mile from a standing start was made in 35 8 seconds. The records with flying start for two miles, five miles, 10 miles, 10 miles, 25 seconds, 10 miles might minutes 93 as seconds, and eight minutes, 452 seconds four minutes, 92 seconds, we minutes, 452 seconds four minutes 93 asconds, and eight minutes, 452 seconds represented.

#### American Substitutes for Boxwood

THE amount of genuine (Turkus) Fernan, Corscan, Lee English) beawed imported into this countries has been reduced to such an actent that the price is not been presented by the contribution of the countries of the contribution of the present the p

substitutes disknown which in all respects is the equal of boxwood for the more exact ing uses especi-ally for engraving blocks for printers It is, however, the opinion of the Forest 1 roducts Laboratory at Madison, that certain native fine-textured woods can be used to a large extent for some of the pur-poses for which boxwood is used

The properties which have given boxwood its repu

must be found in a saissfar tory substitute are respine and uniform texture, a fairly high degree of hardiness—so that the wood will take a fine polasi, will not wear away easily, and will work smoothly under tools—freedom from gumes and resus, and a light, preferably yellow-

Among our native woods only two species come anywhere near having all the properties of boxwood. These are Florida boxwood and wahoo, otherwise known as strawberry bush, or burning bush

strawerry buss, or ourning buss.
Florids boxwood, which grows abundantly in Florida and the West Indies, is a hard, yellowish wood of very uniform texture. Though it is somewhat coarser than true boxwood a fact which would be a drawback to its use for the finest work, it is probably the best substitute, when availability is considerable.

Whoo grows in most of the wooded regions east of the Rocky Mountains, but status the proportions of a tree only in southeastern Arkanese eastern leass and the Appalachian regions south of Pennsylvania. Its wood is not quite so hard as that of boxwood, but it has an even finer texture. Owing to the earcardy of merchastable material of this species, its value seems to be unappreciated. Trunks three or four inches in diameter would undoubtedly work up well into chessmen and rules, and larger sections could be used for engraving blocks of the properties of the properties of the proting of the properties of the properties of the protaining the properties of the properties of the prolation of the properties of the properties of the prolation of the properties of the properties of the prolation of the properties of the properties of the protaining the properties of the protaining the properties of the protaining the properties of the properties of the properties of the protaining the properties of the properties of the properties of the properties of the protaining the properties of the properties of the properties of the protaining the properties of the prop

A few other native hardwoods have somewhat the same characterates as boxwood and might be used for the less exacting forms of engraving or the manufacture of cheaps rules and novelities. Among these are witch basel, great rhododeadroin, mountain laurel, thornapple, orange wood, torthwood, mastic and yellow buckey. Mastic and torchwood might be obtained in sufficient quantities in southern Florida to make their exploitation profitable. The citrus orchards of Florida and California furnable a considerable quantity of orange wood sach year. Buffi-

#### The Death of Professor Pickering, and Other News of the Month By Professor Henry Norris Russell, Ph.D.

HE first duty of the astronomical chronicler this I mouth is a sad one to record the death, on February
3d of Professor Edward ( Pickering, the distinguished Director of the Harvard College Observatory, and the Director of the Harvard College Observatory, and the dwan of American astronomers. In 642 years of his service at Harvard cover practically the whole history of inciders astrophysics and in all this period of unex ampled activity he was a moving spirit. When he began his work the measurement of the brightness of the stars. had hardly been more than touched and the very definition of the scale of stellar magnitudes was still in debate. Only a few sporadic efforts had been made to photograph the stars and practically all that was known of their spectra depended upon difficult and inaccurate visual observations with small telescopes

In all these lines of fundamental investigation Harvard, anali these lines of fundamental investigation Harvard, under Professor Picktring, took the lead. The details of the scores of investigations which were extract to completion under his guidance of the Harvard Annals. Not even the haldest summary of them would be possible here. Suffice at to say that the conclusion of the control of th

the measurements of more than forty thousand stars, accepted as the inter-national standard the Harvard Library of Photographs developed into a collection of about a quarter of a million plates—each a unique record containing in some in-stances, hundreds of thousands of individual facts regarding the stars the Harvard Classification of stellar spectra like the scale of magnitudes adopted as the international standard, and the great New Draper Catalog, giving the spectra of about 220,000 stars completed in manuscript and partly printed

The expense of publishing the one volume of this last monumental work which has so far appeared was met by Professor Pickering himself—and the intense love of his work which is revealed by this was characteristic of the man No one could have been more unselfishly devoted to his have been more unscinsing devoted to his chosen calling, and he was always willing, to go out of his way to give any aid in his power to a colleague whether by furnishing him with material from the great storehouse of the Hervard collection or by bending his influence, and wise advice in obtaining new instruments or funds for the enlargement of his work. His de-parture will leave a gap in scientific circles, both in America and abroad, which will be very hard to fill

#### Our New Next-Door Neighbor in the Celestial Community

Turning from these memories to the nuring from times memories to the news of the astronomical world, the discoveries that deserve most comment are told in a copy of the Publications of the Astronomical Society of the Parific, which reached this part of the country only westerday. One note of decided

part of the country only yesterday One note of decided interest here deals with another near neighbor of our interest here deans with another near neighbor or our solar system—that is near as the stars go. This is a tiny star between the twelfth and thirteenth magnitudes in brightness, which was picked up by van Maanen at the Mount Wilson Observatory in the latter part of 1917, upon plates taken in a search for a possible faint companion to a rapidly moving brighter star. Upon companing photographs taken a couple of years apart, no such companion could be found but one of the monaphonous stars was found to have shifted its position. inconspicuous stars was found to have smitted its position very considerably, and to havethe remarkably large proper motion of 3 01 seconds annually. This rapid motion, which is exceeded by only a score or so of stars made it probable that the star was relatively near us in space

Observations for parallax were promptly begun by the discoverer, and now from 16 plates taken with the great Mount Wilson reflector, he finds the large value 0.244 geond, with a probable error of only one-thiriteth of its amount This means that the star is at a distance of about thirteen light years and nearer than all but perhaps twenty of the millions of stars which appear to pernaps wonty of the minimum of stam which appear us our eyes to be brighter. If it were not so very near us we could not see it at all for it is one of the faintest objects of which we so far have knowledge, being only 1-6000 as bright as the sun. Even Barnard's recently

discovered "runawaystar is two or three times as bright as this, and the only fainter star which is so far known is Innes's companion to Alpha Centaur!

The most ourloss thing about this newly discovered object, however, remains to be mentioned. Its spectrum is of type F, similar to that of Canopus, and indicates a higher surface temperature than that of the sun, and direct measures of the color show that it is also whiter than the sun, indicating again that it is hotter But if it is hotter than the sun, it ought to shine more brightly per square mile, probably two or three times as brightly, at the least, and this would mean that its superficial area was less than 1-10,000 that of the sun, and that it was no bigger than the carthi

there is no doubt that a body the size of the earth if it could be heated so that its outer atmosphere was at a temperature of some 8,000 degrees (entigrade, would be very similar to this tiny star in brightness, color and spectrum But there is very good reason to doubt that so small a body could stay hot—to doubt that enough heat could be produced made it to supply the loss by radiation from the surface

At 11 c clock Mar 8 At 10½ o clock Mar 16 At 10 o clock Mar 23 At 8 % o clock Apl 7
At 8 % o clock Apl 14
At 8 o clock Apl 22 At 014 o slock March 29

NIGHT SKY: MARCH AND APRIL

We know too little, however, of the sources of the heat the stars radiate so fiercely into space to make it which the star ranks so hereoly into space to make it aske for us to dogmatise upon questions of possibility. All one can say as that either this newly discovered body is hardly larger than the arth, or cless it is much larger but for some reason does not shine as brightly per equire mile as might be supposed from its spectrum and color—leaving it to future investigation to solve and color

#### A Double Star of Unusual Interest

A Double Star of Unusual Interest
A second communication of much interest, from
Adams and Joy at Mount Wilson, deals with a number
of new spectroscopic binary stars. One of these, known
as TT Aurigas, is of unusual interest for it has been
known for years that it was double on account of the
variability of its light saused by the alternating solipse
of each star by the other Now the spectrascopic
observations confirm the duplicity, two spectra being
vanile, with lines at sizes so weldy separated that they
indicate a relative velocity of 440 kilometers per second.
From the photometries observations it is known that the indicate a relative recently or soot knowners per second. From the photomester observations it is known that the period is 32 hours. With the orbital velocity of 450 kilometer, this would mean that the stars were 8,800,000 kilometers apart, and that their combined mass was about twelve times that of the sun. Now Shapley, from the photometric data, finds that

the diameters of the two stars are respectively 61 and 59 the cummerers of the two stars are respectively 61 and 50 per cent of the distance soparating their centers. This leads to the estimate that the larger and brighter star is 5,000,000 kilometers in disrester, or about three and a half times that of the sun, while the fainter component is of just about three times the dismester of our orb of

Both stars show helium lines in their spectra, and are probably much brighter per square mile than the sun, so that it would be a reasonable guess that the combined brightness of the two is three or four hundred times as great as the sun's As their combined light exceeds but intle that of a ninth-magnitude star, the distance of the em must be very great, probably as much as 8,000

these numerical estimates are provisional, and will soon be superseded by exact determinations, but there are so few stars for which the actual diameters are known that even these rough values are worth recording

#### The Heavens

The reasume
At our accustomed hour of watching, the splendid
group of the winter constellations has
swept far into the western skiese Canis
Major, Orion and Taurus he low along the
manufacture and western horizon Canis southwestern and western horizon Canis Minor, Gemini and Auriga are high above them, with the planet Jupiter adding to the brilliance of the second named Leo is bruinage of the second named Leo is very high in the south, with Saturn as an added luminary Hydra stretches its huge length below, with Crater and Corvus upon his back Virgo and Bootes are well up in his back Virgo and Bootes are well up in the southeast and east, and Hercules is rising in the northeast. Cassiopeia, Cepheus and Draco are low in the north, and the Great Bear rides high above the Pole.

#### The Planets

Mercury is an evening star all through March and is well visible about the time of his greatest elongation, which occurs on the 21st On this date he sets at 7 40 on the 21st On this case he sees at 7 40 P M and, being 18 degrees from the sun and 9 degrees north of him, should be con-spicuous, especially as he is unusually bright exceeding Arcturus

enus, too, is an evening star, and is growing increasingly conspicuous. She remains in aight until 740 P M at the beginning of the month, and at its close does not set until 8 50. She is about 10 degrees higher in the sky than Mercury, when the latter is at his best, and should serve as an excellent guide in finding him

Mars is likewise an evening star, but too mars is moving an evening star, but too low to be easily seen. On the 11th he is in conjunction with Mercury, and the two planets are only a degree apart, but it will take a good glass to pick Mars up in the twilight

evenight of the sun of the sun of the sun of the sun on the 28th. He is high in the sky all the evening, and does not set until well in the small bours. Sature is in 160, and is admirably placed for observation, crossing the meridian at 10 P. M. in the middle of

tion, trosse

tion, crossing the meridian at 10 P M in the middle of the month Urania is a morning star, in Aquarius, but is practically unobservable. Neptune is in Caneer, and observable telescopically till middight, or later to observable telescopically till middight, or later to construct at 0 P M on the 8th, rull at 11 A M on the 10th, in her late quarter at 2 P M on the 3ch, and have morning to the construction of the 10th, and have month without on the 10th product of the 10th product of the month without on the 10th product of the 10th product of the month without on the 10th product of 

#### Proposed British Bureau of Longitudes

The Royal Society has recommended the establement of a body corresponding to the Franch Bureau Longitudes, to which sould be relieved any adminitive question involving consideration of time or peak

#### How Best to Make the Airplane Safe

To the Editor of the SCIENTIFIC AMERICAN: There has been so much said about the application of parachuse to pilot and observers, and the subject has been given so much publicity in the announced parachuse competition of the Aero Club of America, that a detailed, practical discussion of the practical value of the parachuse and the practical value.

of the paracoute on the surplane would be huminating, alike to aviators and to the public.

Airplane accidents may be classified into three categories: those occurring at high altitude, those at low altitude (near landing) and those which are to be idenaltitude (near landing) and those which are to be iden-tified as first. Off the three the second class furnishes the overwhelming majority of cases, for several reasons. The pitot on nearing the ground for landing is compalled to maintain a speed of about fifty miles per hour (varying somewhat according to the design of his mechine); if by any missabulation he falls materially below this speed, a cresh to the ground is almost inevitable. Moreover, at such a speed and at such close quarters with the ground, a little variation of the angle of descent very often causes a nose-dive which there is not room to check before a crash comes, or perhaps a capsising of the machine after touching the ground. With all these considerations foremost in his mind, the pilot must meet considerations foremest in mis mind, the pilot must need a third requirement; he must maintain correct horisontal belance during the approach to and the slighting upon the ground. In a forced landing, where the aviator is compelled to fly low around the limited area which he has picked for his landing, this is particularly

It is obvious that in these cases a parachute would be It is obvious that in these cases a paractute would oo of no await, there would be neither time for it to be used, nor the height for it to open. With secidents at high altitude is appears at first as though the revorse were the case; and certainly we must admit that here the para-oute will have sufficient drop to make it open. But such accidents are mainly due to loss of motive power, and ordinarily the pilot in such a situation saves both himself and his machine by skillful maneuvering. Bo true is this a pilot frequently shuts off his power pur-posely to dive at will; and his psychological tendency in an accident of any sort at a reasonable altitude is accordingly to sit tight and try to straighten out the machine. Besides, while diving accidentally at terrific speed he would have but little chance to extricate himself from his tiny cockpit and jump from the machine to take a chance for his life with a parachute—I say "take a chance with a parachuta" because in the comparatively few tests
made there have been eases where the parachute failed
to open. For instance, this occurred to the unfortunets
Leon Moles at Venice, Cal., on August 18th last, when
he stepped from his plane to death at an ultitude of 7,500
fest. Finally, even if the avistor got away from his
mackine and safely to earth in a parachute, there
always the possibility of fatality through the orash of the wild plane against other people or into a building.

A further cause of accidents would be by collision

which may cause, say the collapse of the motor. case the pilot could glide the machine safely to a landing, as he does when his engine goes dead from internal causes. Or if the wings had collapsed or the machine was a total Or if the wings had coulspeed or the machine was a total wreck in some other respect, the speed of fall would be so terrific that the pilot would have no chance to unstrap himself and climb over his seat.

There remains the case of fire sloft. In this case, which may be more or less serious, the pilot may have

which may be more or less serious, the pilot may have the opportunity to use some stalinguisher, as has actually been done in certain instances; or he may side-slip his machine to that the rush of air will blow out the fire. The only occasion where it would be really in order to consider jumping with a parachate would be in the event of a continuous first in the metor, with the latter in root of the pilot. But the present beginning in planes is more

of a continuous first in this mator, with the latter in front of the pilot. But the present tepdency in plane is more and more toward a multiplicity of motors, mounted far from the pilot and other conquisate.

With this catalog of the sources of needent before us, it is clear how very limited may be the practical utility of a paractuit attached to the pilot. Upon long consideration of those reasons, especially those persisting to low-stitude modelman seis fanding, which are by far the most frequent once, if she that the nod ymeans of adequisably insuring estaty on an airplane is a device that a would save both the macking and its occupants. Such a device that

and must be within easy and immediate control of the pilot. It should consist of a collapsible frame covered with light fabric randared fire-resisting. This member should be so formed that when fully developed it would about one so formed that when may developed it would form an emergency wing to engage the air in front and let it seeape through the rear. Note that a paraches cannot do that do necount of its spherical shape. The emergency wing or surface should be so designed as sta-stabilize itself automatically in fign position against any air pressure, no matter what the direction of fall. Such a device should have about ame-fortieth the weight of the machine, and during flight the major part of its weight should be earried idle by the flow of air. The device should not offer much head resistance when inoperative -- say, one-eighteenth the total resistance of the plane as a whole. It should be designed in such a way as also to not as a brake when required, especially in avoiding collision in close formation

Low-altitude accidents would be avoided, especially those incidental to landing, by the same device acting those incidental to landing, by the same devere acting to change subconstacilly the angle of flight upward, exusing the plane to lift its nose and arrest simultaneously attained to the stability that bride possess in landing -they will be noted to arrest jitheir speed by curing their wings and tail, while simultaneously they throw ther head upward and land on their feet. In other words, the air-plane should follow nature as closed as possessly plane should follow natures actioned as possessing the stability of 
It is obvious that we cannot expect in practice the wing of an airplane to reduce its speed, but an adequate surface should be developed against the rish of air, with such a pulling resultant applied at such a of the plane as to create a new rotating moment

point of the plane as to create a new rotating moment espable of adequately raising the nose of the machine at the moment of landing, while arresting its speed. On the other hand, it is understood that an airplane could not carve a different safety device against each different type of scoident. Hence the need for one good the device incorporated upon the machine with more the limitations of weight and air resistance that I have mentioned, and capable of such automatic move ments, by the flow of air itself, as to cause at the easy ments, by the new or arr itself, as to cause at the easy and secure control of the pilot whatever new automatic combination of forces might be needed to render the plane more bird-like and afford the pilot and his companions incomparably more safety than a mere parachute. GARTAN AJELLO.

#### Safety for the Standing Train

To the Editor of the SCIENTIFIC AMERICAN: Referring to Mr. Bued's derail and signal to protect Referring to Mr. Bradi's derail and signal to protect a workman, as pictured in the Reinvirus Alemican of December 7th, why not, as suggested by another practical railroad man, employ the salue means to protect a train? By the use of the derail and of another asf-curad as readly applied, rear end collusions, the most dreaded and destructive of all train wreeks, might be always prevented, or some as near it as luman means permit.

While all trains are protected in front by heavy locomotive, mail and express cars, the rear is exposed to complete destruction when a high speed projectile of a ousand tons perhaps, is hurled upon it at terrific speed tituusinat totis perinspa, is furried ujoni it at territe speed. Occupants of rear care on the best managed roads are in a sense always in danger, not increly to life and limit, but of death in its worst forms, by fire and steam, and there are those who never ride in rear coaches when others are available.

The suggestion is that all standing trains at stations The suggestion is that an attaining wants a sure the protected by turning a switch behind them, thus cutting them off from the line, permitting the following train, if out of control, to pass by on some other track, or in case none is provided to run off the switch and be

Out upon the line the derail would be employed to protect any train unexpectedly forced to delay. Carried always in the rear car, it could be seated at once upon the rail, where, in case the following train got by the fing-man, it would throw it from the track. It would as bstitute an intentional wreck for an accidental one a case of the greatest good to the greatest number, as where a building or a block is blown up by dynamite to save a much greater loss by fire.
I have before me the SCIENTIFF

re me the Scientific American of September 21st, 1912, with a list compiled by Mr Fisher of Taunton, Mass., of the wrocks of "our fast trains" in four months, peginning with December, 1911 There were 18 of them. hight were derailments, but by far the greater number of again were deraneouse, but by tar the greater number or fatalities in proportion were caused by collisions, where trains ran by signals and struck standing trains. Within a month of this writing there have heen four cases of this kind noted and all attended by loss of life. Apparently, had the standing train in every instance been protected by a switch or a densit, the loss of life would have been comparatively slight and of property much loss. A great general has said that in war nothing is left to

chance. It should be as true of the transportation of human freight. On the Mt. Washington Ranway, still the steepest in the world it is said, every precaution that ingenuity can devise is taken to prevent a runaway. But with trains following one another so closely on a level, with signals obscured by fog or storm, or over-looked by the tired or overstrained eyes of an engineer, there is nothing absolutely to protect the closely packed coaches, but isolating them from their pursuers on the

The greatest saver of life and property, the airbrake, was forced upon the railroad men much against their will. Why not force them still further to insure the lives of their passengers by the reasonable means noted? GRORGE S. PAINE

#### Concerning Cotton Seed

SEVERAL months ago we secured, through one of the commercial photographers, an attractive series of pictures taken in a cotton-seed mill. No member of our regular staff felt himself sufficiently acquainted with this rather special field of industry to prepare an article that would come up to the SCIENTIFIC AMERICAN standard; so we sought an outside source of information. put the pictures in the hands of a man who had con-tributed on similar subjects in the past, who had always shown himself competent to handle them, who said be could handle this one, and from whom we had every reason to accept this claim. In due course the article came along, and was printed without further scrutiny,

under the above title.

It must be realized that the editor of a sheet like ours peculiarly in the hands of his contributors. physically impossible for our regular staff to hold an expert on every department of modern science and inexpert on every repartment of monern science and in-dustry; there must arise many occasions when we have to call upon outside writers. When we sak such a person to contribute, it is because he is credited with knowing more about his subject than we do; and we must then ordinarily accept his discussion at its face value. We do not accept offhand anyone's claims or anyone's reputation; but in spite of the utmost care there is bound to be an irreducible minimum of cases in which our best judgment is betrayed.

The gentleman who was supposed to write with authority upon cotton-seed oil turned out to be ludierously ignorant on that subject. Apparently he con-sulted same inadequate works of reference, and perhaps one or two ignorant mill-hands, and got up on this founda-tion a typical high-school composition on cotton-seed oil. This he paimed off on the SCIENTIFIC AMERICAN as a scientific discussion. Some of his errors have been pointed out to us by kind-and unkind-friend

The fact that cotton-seed oil gums badly does not coessarily imply that it will never be useful as a lubriaccessing https://with every to discut as a futur-cant; some means will porhaps be found to overcome this objection. This fact, however, does make it at present out of the question for cotton-seed oil to qualify as a lubreant; and in any discussion of the oil of cotton as a substitute for the oil of the castor bean this item should be given first place, instead of being ignored absolutely. It is the present controlling factor.

Doubtless the placing of the world's annual production

of cotton-seed at ten million pounds, instead of as many tons, was a slip; we have verified that it was our contons, was a sup; we have vertice that it was our con-tributor's slip, and not ours or our printer's. Perhaps he knows that Egyptian cotton-seed has never com-manded a premium in America; if he does, his general statement that it sells higher than American seed is an

Our contributor says that the coating of lint on American seed runs about 20 pounds to the ton. The Government says that no cotton-seed mill may run unless it produces at least 145 pounds of lint to the ton.

Our contributor mentions a law against the stacking of seed near the gin, and he mentions a fan attachment for linears The promulgator of the law in question, and the inventor of the fan, have succeeded in keeping all

knowledge of their work from the millers.

Cotton-seed oil is not colorless; it is described as "mahogany red." American mills, instead of suffering "mahogany red." American mills, instead of suffering a refining loss of 11 to 15 per cent, feel that they have done badly when this loss exceeds nine per cent. Planters seldom dispose of cotton in the boll; ginning and baling are with equal seldomness done at the mill.

To date, these are all the inaccuracies which have been brought to our attention except that the photog rapher transposed the captions of two of his pictures, and that the self-styled expert never noticed the error Unfortunately, however, while a figure of .400 is highly satisfactory as a batting average, it is a trifle below normal in the preparation of a scientific article. We accordingly arise to express our regrets at the imposition which has been practiced upon our readers, and to assure them that they will not again be imposed upon by this writer.

#### Army Telegraph Work in France

ACCORDING to a recently published account the Army has handled the extensive telegraph work incumbent on it in an efficient manner On November 15th, 1917 American telegraphic communication was opened between Bordeaux and Paris, with a few telegrams By November 15th, 1918 the small office had expanded into an establishment requiring a personnel of 50 men and a plant with 32 desk tolegraph outfits from which radiate circuits to 25 outside cities and camps. On one day, October 8th this central office handled as namy as 4.00 telegrams. One of the quokest wire-laving jobs on record goes to the eredit of men stationed at a rest camp near by At the time when the telephone exchange was moved from its former location to the new headquarters it. was necessary to n stall 100 circuits be-tween the new building and the French Exchange a distance of nearly a mile, through the busiest part of the business The presence of signal and pow wires in the air at various points made the installation of an overhead cable impracbackanatoli of an overland table impracticable A full Infantry Company of 220 men was selected for duty. They went to work at 7 P. M. with picks and shovels, and with the aid of 12 acctylenc search and with the aid of 12 acctylene search lights they worked all might At 7 A M they were relieved by another Infantry Company increased by another Infantry Company increased by the search of the Signal Corps; 50 men and 20 colored stevenions 17 few work continued in than way from 7 P. M Triday sight until 2 A.—M Monday, when the states cable was completed.

Transforming British soldiers into civilians. At the left they are heading in their riftes and other equipment; at the right they are being measured for the civilian clothes which the government will forward to their homes

#### Reconstruction in Europe—IV

From Fighting Line to Factory

By C. H. Claudy, Foreign Correspondent of the Scientific American in London

In A Job for Every Man in the Scientific America America To Documber 23st a naturapt was made to show how the United States was handing its demolistation problem from the standpoint of the individual soldier ta the State the problem is largely one of the individual for we have taken but four millions roughly from a total population of over a hundred millions.

and our commercial expansion is such that there are more jobs certainly than there shere are more jobs certainly tran there are skilled men to fill them, and probably enough jobs for all the unskilled if a reasonable interval is allowed for the ab sorptive power of industry to work upon the demobilised men

In Great Britain, however, the problem presents complications which America happily does not have, and it is, therefore to the greater credit of the nation that such very comprehensive plans should have been worked out well in advance of the need

worked out well in advance of the need It may be wise to consider for a moment the real problem of all demobilisation, as opposed to the view of it entertained by the thoughtless, and particularly the relative of the man to be demobilised It is no more than natural that mothers cannot understand why their sons cannot cannot understand way their sous cannot be immediately released, when the need for their services has passed and demobilisation means to many who have not reflected, merely the process of transport-ing a soldier from fighting field or training

ing a soldier from highting field of training camp to his home town and turning him loose but to those who must guard the welfart of the body politic as a whole regardless of the wishes of loving relatives, demobilisation means the intricate process of turning a war machine into a peace machine of relocation of men in constructive and productive labor of salving as much as may be of war equipment of turning factories and

1

Demobilized men receiving their unemployment denution policies at the Wimbieden Dispersal Camp

depends, in a very large measure, the solution of the question as to whether the world is to be a safe place for a true democracy or a breeding ground for Bolshevam. The limiting factors in any scheme of demobilisation which is to be comprehensive and effective and not end in catastrophe and fold serve first, transportation, second, distribution of labor, third, absorptive power of in-

industry generally from the production of monutions to the production of those things which peace needs, all swithout interfaring with the fundamentals of human life—food, clothing, shather—to such an extent as to cause first physical and then mental distress.

Upon the success with which this task is performed

mber of men ean be flung into industry, the ability of industry to turn from making, let us say, shells to baby carriages or from artillery wheels to automobile wheels, must be considered, and finally, before any industry can resume its peace base char-acter it must be assured of an adoquate if not an ample supply of the raw materials by means of which it actes. The supplementation of the supplemental of the one of the supplemental of the supplemental on more to England than to America But the Englash method of fitting her demobilisation scheme to the fundamentals is very complete and very well worth study

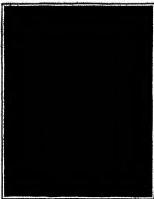

study its most salient characteristic is that men are to be demobilized not by military units, but by the requirements of industry in other words, demobilisation will be by midvaluels, not by companies, regiments or other military divisions. This is more difficult, from the military point of view, but influsted by preferable from the common count of were

but affautely preferable from the economic point of vew part of the point of vew part of the point of vew part of the fact is not plann, it may be many to the troops abroad to demolities all the troops abroad for first, thus gridge them the "pack of the jobs," merely because they happened to be on the spot, Agan, demolitaing by individuals and not by military units means an infinite duplication of orders, routing, collection, porcing, feeding and housing—to do these things for a regiment is one thing—to do the property of the property o (Continued on page 228)

The "accustic lens" of the hydrophone, seen from outside the ship, and an interior view showing the operator at work

#### The Hydrophone for Locating Submarines

#### An Ingenious French Invention That Did Much to Make the Seas Safe for the Allies

MUCH reliance was placed, during one period of the sur, upon the use of airplanes in the detection of submarinas. The fact is, however, that when the U-boat submerges to a depth of 15 yards its whitish treal is invisible from above, and we must fall back upon some other means of losating it, and thus onesan wound of the count waves propagated by the review and sublished the count waves propagated by the review and sublished better that which they extend that while these waves travel through water with a speed four times that which they exhibit in air, there is no nosability of perceiving them directly war. It as no possibility of perceiving them directly by ear. It is necessary to have recourse to an instrument which can is necessary to navy recourse to an instrument which can pick the waves out of the water and transmit them to a listoner lodged in a habitable medium Several such devices existed before the war In addi-tion, a quantity of inventions of one sort or another have

listoner lodged in a habitable medium. Several such deviewe autated before the war In addition, a quantity of inventions of the sort or another have seen the light of day since. The range of all these listeners varied greatly, being affected by factors as yet imported to the sound of the sort of another have seen the light of day since. The range of all these listeners varied greatly, being affected by factors as yet imported to the sound wave are received. On the average, the hydrophones of common type will detect the presence of a submarine at a distance of two or three thousand meters, and of a large surface squadron at ten or a dozen kilometers. But all these instruments surface from the very grave diadvantage that they will work only when the size of the sound wave and they are monitored in stopped, so that its same of the sound there is but one sound they modute only in the crudent fashion the direction from which it is received. There was encordingly the very obvious and very crying need for a hydrophone that would work white the slip was remained, and that would be estimated to the same to be sound they modute only in the crudent fashion the direction from which it is received. In the old it was a French navel lieutenant, George Weber, who solviewed the success which had cluided the world's avanta for three years. He solution of the problem is a highly ingestions one, depending upon a very simple principle of privation, yet one which it is not coursed. In the cent it was a French navel lieutenant, George Weber, who solviewed the success which had cluided the world's avanta for three years. He solution of the problem is a highly ingestions one, depending upon a very simple private of the sound of the problem, is an even of the sound of the problem, is an even of the sound of the problem, is an even of the sound of the problem

sufficiently remote, which remain parallel so long as no obstruction is interposed in their path and which are

amounted year-one states than a manufacture of this as no as they are abled upon to enter a medium of different density from that in which they are propagated. And it is just so with sound waves. Walser therefore interposed, in the path of sound waves, a sort of sounds least Just as in the case of light, the causes the individual waves which make up the sound complex from a given sure to come to a foous, with the double effect of straightening them and isolating them from the sounds this proceed from other sources. In fact, the several sources of sound give rise to as many fort, of which the glometric locus can be care in the complex from a given the position of the sound focus which pretains to any particular source of sound, the position—of at least the direction—of that source can be calculated.

Once the general idea had been formulated it remained for the lieutenant to work out the practical details. As finally adopted and used with these success

details As finally adopted and used with huge success in the detection of submarines the a outsic lens was in the form of a spherical segment A set into the side of the chaser or destroyer. In the bulging surface of this are a series of circular holes B each filled with a sensitive where so circular noise is each thed with a schmitter vibrating plate C. The effect is to focus relations all sounds received and the focal points all lic on a circle I, whose position of course, depends upon the radius of the lens

Working sarts of the bidrothese (see text for references)

segment and other factors which can be controlled. There are two of these lenses on each vessel, one to port and one to starboard. The two give upon a single cabin, which of course extends the entire width of the abin, and is well insulated against sounds at all points aver the two lenses. The observer is seated in the center of the cabin with a listening helmet to which are attached two ear-tumpets of which only one is absured in the context of the cabin when the starburger of the cabin care.

the the second the sec appears in the general view, and the mechanism is so adjusted that as the operator turns the handle of

adjusted that as the operator turns the manor or this drum, the two trumpets revolve about the respective focal circles of the sounds received. The counterweight J and cord is hold the trumpet in a position where its axis is constantly directed toward. a position where its axis is constantly directed toward the center of the spherical lens. The counterweight L maintains the equilibrium of the mobile arm F. The counterweights M. M. cause this arm to oscillate about the prote N, N. in such manner as to counterbalance the effect of the shup s intching and keep the mouth of the trumpet always in the same horisontal plane entire apparatus is supported by the frame O

In using the apparatus the observer can hear a given sound, not only when the trumpet is precisely centered at the focal point of that sound but when it is anywhere in the neighborhood of that point. He hears it loudest passes through the focus so that the trumpet is centered about the focus He explores the field by keeping the trumpet continually in motion and he locates every suspicious sound by carefully bringing the trumpet to the position where it is loudest and clearest. The in-strument has been previously calibrated so that when he succeeds in getting the maximum intensity for a given sound he reads the direction of its origin on the scale that runs about the edge of the drum. The distance is then estimated roughly by taking account of the intensity of the sound at its maximum and it is then easy to steer a straight course for the source-and if the latter be a submarine, to pass directly over it with mathematical accuracy and drop sudden death upon it

The first successful experiments with a more or The first successful experiments with a more or less definite model were made on March 21st, 1917. After that, progress was also both in the way of removing the last technical obstacles, and in the more difficult business of convincing the "appropriate authorities" that here was something good. All these difficulties were surmounted, however the apparatus was installed, and on March 16th, 1918, it received its beparism of fire. Its success was immediate, and from that date to the and of the way it made a very large contribution to the end of the war it made a very large contribution to the sullification of the submarine mensoe

# A CAMPAIGN TO PROTECT YOU IN BUYING

ALPH WALDO EMERSON, speaking in one of his essays of a distinguished man, said: "He is put to-

gether like a Waltham Watch."

No finer tribute was ever paid this American, masterpiece than when the Sage of Concord used it as the symbolic character of greatness.

The Waltham Watch represents the genius of many men whose inventive faculties have been concentrated for nearly three-quarters of a century to make it the wonderful time-keeping device it is

Among these famous watch makers and inventors is enshrined the name of Duane H. Church—a man whose marvelous grasp of the principles of mechanics filled the great shops at Waltham, Massachusetts, with exclusive machinery that performs miracles of accurate and delicate work which the human hand could not equal.

Many of these machines are awe inspiring to the beholder. One of them will do the work of a hundred skilled workmen—do it better and with

Duane H Church, fumous tracestor who filled the great shops at Waltham Massachusetts, with evolution worthmoting machinery that porforms mirecles of accurate and

greater accuracy. They demonstrate American mechanical skill at perfection.

To see these machines is to know beyond the shadow of a doubt why Waltham is the "World's Watch Over Time," and why the foreign-built watch cannot compare with it in time-keeping dependability.

# WALTHAM

THE WORLD'S WATCH OVER TIME

## NSTRUCT YOU IN CHOOSING YOUR WA

The buying of a watch is an important matter. It is an investment in time-keeping. And time is the most valuable possession of man.

Very few people know anything about watches.

The "works," or mechanism, of a watch is a mystery. Yet we can truthfully say, "A watch is only as good as its works."

You buy a watch for one thing—to keep correct time for you-to tell it to you with dependability any moment of the day or night.

A good watch must have something more than good looks—it must have good "works."

Millions of people imagine that the "best" watch is made abroad - or, at any rate, that its works are imported from there.

Yet, in competitive horological tests at the world's great Expositions, Waltham has not only defeated these watches of foreign origin, but all other watches as well.

In a series of advertisements we are going to show Americans that there is a watch built in the United States whose timekeeping mechanism is superior to that of the foreign-built watch, -

A watch that is easily and reasonably repaired because its parts are standardized.—

A watch that represents American leadership in mechanical skill.-

A watch that has revolutionized the art of watch making and assured accurate and dependable time-keeping.

In this important series of advertisements we are going to take you through the "works" of a Waltham watch; lay bare those hidden superiorities which have led the horological experts of the greatest nations of five continents to choose Waltham as the watch for the use of their government railroads.

We are going to strip away theory and show you facts-every part from the frame to the dial, hands and case.

When you finish reading these advertisements, which will appear regularly in the leading periodicals and magazines, you will walk up to your jeweler's counter and demand the watch you want - because you will know how it is built and why it is superior to the foreign watch.

Look for these advertisements. Read them.

When hung in the center of a barn it sheds a splendid light into all corners. It is not necessary to move it about as it he case with the common kerosone, wick laintern.

#### Official List of Farm Tractors

IN connection with the annual Farmers Week activities at the Ohio State linuversity the the Ohio State linuversity the Ohio State linuversity the Ohio State linuversity that the Ohio State linuversity of the Oh

necessary adjustments to put the motor in good running order. The load was gradually increased while the motor was warming

At the close of this 30-minute period the motor was adjusted to run at a speed as close to its rated r p m as could be secured and at the same time the brake was at justed so as to give the tractor its raid load. A one-hour fuel economy test was then run.

The motor fuel line was disconnected and connections made to a tank resting on a delecate scale. All tractors used fuel from the same source. At intervals of 10 minutes, fuel weighings were made while at the same intervals the speed of the motor was taken. This made it possible through the several intervals to check the

constancy of fuel consumption as well as the emciancy of the motor governor

At the close of the one-hour test the motor was given all the load that it could pull with the operator given permission to increase the speed if he as desired and was able to do so. The maximum load was pulled for 30 minutes.

minutes

The accompanying table shows in detail the results of
the tests Many interesting observations can be made
by studying the figures here shown

by studying the figures here shown

Of the twenty-three tractors tested five had twooyinder motors. The two machines gruing the lowest
tiel cost per horse-power hour were both two-oyinder types and both burned kerosane. The average fuel four
types and both burned kerosane. The average fuel four
the average of all four-cylinder motors hours.

Reference of 0.45 cant. This would mean a difference in cost in favor of the two-cylinder type of 9 cessis per
the one of the four-cylinder motors made very powerhour with the motor developing 20 horse-power. However, some of the four-cylinder motors made very power
test and if the best lester on this type of motor are
test and the basel teste on this type of motor are
ference is only 0.69 cent or, an amount equal to only
18 cents per hour for a motor pulling 20 horse-power.

Is should be remembered, though, that the burning of
keroence gives rate to some difficulties in motor operation
and that fuel economy is not the only consideration.

Asother native afford-

A motor cultivator drawing a grain blinder

#### Another Use for the Motor Cultivator

THE motor cultivator is, quite naturally, I used on farms growner a large screege of core, but, eva as, the surper the number of core, but, eva as, the surper the number of core, but, eva as, the surper the number of core and the surper of 
# Being a thousand times

N a great quiet room of the Billings & Spencer plant, row upon row of master craftsmen give the best there is in them to a work as delicate as fine watchmaking.

They are cutting, with lifetime trained fingers, the shapes of the forgings in great blocks of solid steel.

They are making the master dies, and no matter how long the task may take, the only requirement is absolute accuracy—absolute compliance with specifications.

For when that die is gripped in the ram of a great drop hammer—when it falls with crashing weight upon the bars of white-hot steel—forgings take shape which duplicate that die to the hair's breadth of an inch. The die cutter is right, not once, but a thousand times.

So it is with the men to whom fourteen-foot hammers are pliant servants—and the men who for a lifetime have studied steel—and the men who do nothing all day long but temper dies—their only goal is that the Triangle B forging shall be right, not once, but always.

This company is the first commercial drop forging plant in America

When Abraham Lincoln entrusted to C. E. Billings the forging of the pistols of the Black Horse Cavalry, he made possible the beginning of that iong and homorable record which has culminated in the great Billings & Spencer plant of today "Into every forging goes our entire reputation." That is the Billings & Spencer creed.

#### Inventions New and Interesting

A Department Devoted to Pioneer Work in the Arts

#### An Overhead Cable Track Supported from Both Sides

SOMI FIMES a discovery or invention ten be spoken of as lawing solved the problem of this or that Sometimes on the other hand the inventor succeeds in doing something which prior to his disclosure would have been conceded by everyone to be impossible—something which appeared so obviously out of the question that nobody would ever have quest in that nobody would ever have thought of trying it—something in con-nection with which therefore the exist ence of a problem to be solved would never have been two massed. There have been two ways of running

in constant contact with an overhead wire whi h is sufficiently long to require support at other points than its ends One is seen in the ordinary trolley wheel one is seen in the ordinary roney when where the wire is sufficiently undersiting from its supports to permit a more or leas deeply groved wheel to run in turn under it. The other may be found in various places where a carrier of one vanous places where a carrier of one sort or another is run asspended from a catle it consists in supporting the cable from one side only, on the end of a bracket and in hanging the ear from the cable by means of an outcurving trues which passes around and over the war on its free, side to engage a trilley which above the wire. Of course if there is any material weight to be carried thi procedure involves two wires supported from their opposite and outer sides so that the carrier may itself be supported from some seek side.

A New York inventor has recently put out a device which makes it possible to run a carriage suspended from wheels along a cable that is supported from both along a casic that is supported from both as apparent impossibility has been brought about and the car enabled to pass the supports of the cable is indicated in our cut it will be noted that the member connecting the two traction wheels is traversed on either side by a grooved track in the shape of a circular are and trace in the snape or a circular are and that the carriage is suspended by means of a toothed circular wheel of correspond ing radius. The teeth of this wheel are the things that reveal the servet of how to do the impossible. Open at the ends each tooth engages the circular track on both sides of the wheel truck Until a support is encountered the sus

# "Your Nose Knows"

All smoking tobaccos use some flavoring. The Encyclopaedia Britannica says about the manufacture of smoking tobacco, "...on the Continent and in America certain 'sauces' are employed... the use of the 'sauces' is to improve the flavour and burning qualities of the leaves." Tuxedo uses chocolate—the purest, most wholesome and delicious of all flavorings! Everybody likes chocolate—we all know that chocolate added to anything as a flavoring always makes that thing still more enjoyable.

That is why a dash of chocolate, added to the most carefully selected and properly aged burley tobacco, makes Tuxedo more enjoyable—"Your Nose Knows."

Try This Test: Rub a little Tuxedo briskly in the palm of your hand to bring out its full aroma. Then smell it deep—its delicious, pure fragrance will convince you. Try this test with any other tobacco and we will let Tuxedo stand or fall on your judgment—

"Your Nose Knows."

#### Reconstruction in Europe (Continued from page \$98)

2 000 individuals temporarily brought to-gether at a concentration or demobilisation camp is quite another

England is considering her problem both as applied to her huge army and her very largely increased navy under a num-ber of different heads—it will be impose ner of unferent heads—it will be impos-sible to go into all of them in detail, but their titles are sufficiently indicative of the points of view from which the problem has been attacked

First of course comes the creation of military machinery for the demobilisa-tion itself—in itself no mean task. Next comes the vital question of transportashould be noted here that one of the limting fact its in speed in England, may well be the available wharves and docks which can be spared from commerce to berth the ships which carry troops England faces also the organisation of a new arm) her regulars of 1914 being pracwas incapacitated, or so scattered in the expansion of the present army as to make impossible their becoming even a nucleus of what army she will retain. The are of those unfit for on'll life—the wounded, the mutilés the helpless the I had the gassed the ones who are runed in health from privation, exposuret or (rerman prison camps is a very vital matter in her demobilisation scheme Storage in her demobilisation scheme Storage of arais, ammunition, equipment, ordnace, against any future disposition must be arranged before the materiel can be abandoned by the men who now have it in charge—naturally the millions of pounds sterling invested in material must not be thrown away even if demobilisation of the thrown away even if demobilisation of the man power caring for it is slowed up, for the taxpaver must be considered as well as the fighting man With this problem comes the disposition of animals, vahidas, stores food Net until these matters they been taken care of can the nation believe adequately prepared to handle the effic-

and finally horrible thought though it may seen to the altrurate, adequate plans for remobilization, without which not a wheel is turned in England's demobilization

It should not be understood by this that Great Britain expects another war, or is planning for one. But it would be futile to store cannon and ammunition or dock how unnecessary warships instead of sinking them if no plans were made to man them should the need over arise, and while the belief is universal in England that the war is over, that Germany is defeated for all time, and that the peace to be concluded to be a lasting peace, nevertheless, like the wise traveler in desert piaces, she lays in a supply against the time of need, not-withstanding that she is "fed up with war and all that appartains to war The United States has the same idea, for our draft machinery and our registration records are such as to enable us to remobilise if not with a 'million men over-night as one prominent Chautauquan has many as one prominent Chautauquan has expressed it at least with a speed beyond anything we have ever been able to attain before

The order and method of British de mobilisation begins, of course, with the sick, wounded multilated and war prisoners as soon as they have been restored to the as soon as they have been restored to the best possible physical and mental condition regardless of any other consideration affecting priority of release from service Thus a wounded man in hospital can look forward to immediate demobilisation as soon as he is physically fit, even though he

Next comes demobilisation of men called Demobilizers,' that is, those men required in either a military or a civil capacity for the work of demobilizacapacity for the work of demobilisa-tion—the men, in other words who will form the demobilisation machine. They will be followed by what are called pivotal men, largely skilled artisans absolutely required in certain industries before such can be redstablished, men who will thus he there exactly men before such that the present was heartistics. will thus by their speedy reabsorption, be able to assist industry to absorb other workers beel testers, chemists stand-ardisation experts, designers, technical engineers are cases in point. But in order to avoid even the appearance of unfairness the numbers of men in both those classes will be limited in the extreme and only

who have some definite They are those who have some definite work awaiting them who know exactly what they are going to do and where they are going to do it. They will be released in the order of the priority of their in

dustrial groups Fourth

comes those who have not jobs Fourth comes those who have not jobs awaiting them but whose trade or other employment in civil life is of such a character as to be of high importance is national reconstruction and who will probably have no difficulty in getting work immediately Such mea might be ship workers (oal miners steel tool mechanics

Fifth come the other "non-slip" mer who have no definite employment read; and waiting for them, who will be de mobilised in the order of their importance to civil life and finally the men selecte to form the eadres or skeleton units of military bodies necessarily left out of the general scheme of demobilisation to care for horses, guns, materiel, etc. as long as

such care may be needed

Within this general scheme comes the
preferential device to take care of married
men and men who have served the greatest length of time at the front, as well as sengen of time at the front, as wan as tune-sexpired soldiers and sailors who results and for the war. Within each group as it is demobilised preference will go to the matricel over the single, the long service over the short the regulisted soldier or sailor over the man who has not pre-

debandment of military units, repairance of attempting to get jobs for all her soldiers military units, repairance of attempting to get jobs for all her soldiers military units, repairation of pressures.

while attention has always been directed to incthods of recovering the tin from scrap the importance of such operations has been greatly enhanced and they have been in lertaken on a scale never before

approul

The pr blem of recovery does not at first appear to be a difficult one, and it was bound to appeal to the inventor, for the cut fact mes were glad to give away their rap for the asking, or even to go so far as pay to have it carried away. But in it of the many avenues of attack st t of the many avenues of attack study and experiment before a feasible valuable results to make it a paying proposition

All the processes which have ever actually uperated may be divided into three general classes—mechanical chemical and electro chemical—In the mechanical procmeal chemical and ess the effort was made to separate the tin from the iron by means of heat or, more rrom the fron by incans of test or, more recently by refrigerator Little success has attended such procedure however, mainly because the methods seem funds mentally unadapted to obtain a thorough separation

Most chemical and electro-chemical processes have also failed either because the acids used attacked the iron as well as the actor used actuaced the iron as well as the tin or because they would not dis-solve the tin sufficiently and left consider-able adhering to the iron. In many instances also the chemicals employed were too expensive to make the processualid one financially. Three process owever, have operated successfully for the past 40 years being more or less in competition with one another and alternating in temporary preponderance as now one now another, benefitted from further refinements

The exceedingly simple idea of electrolysis of tin scrap in an alkali solution inof considerable magnitude, but these have all been met at one time or another The process requires the greatest of watchful care, but since the tin is received at the care, nut since with a spongy or finely granulated precipitate which may easily be removed and melted, it offers son spicuous advantages. The case with which the tine and iron may both be utilized when once they have been successfully separated by this process gave it the lead-ing position in the field up to about 1907 When dry chlorine is brought in contact with tin clippings, the chlorine and tin will combine and the anhydrous tetra chloride of tin which is formed will drip off As chlorine at low temperatures off As eniotine at low emperatures does not attack ron, we have here what looks like a promising line of attack. But enitroil of the chlorine gas and of the tin chloride fumes is difficult and workmen are annoyed if not actually endangered then too, all humidity must be oxcluded Inen too, an number was to excuse upon the iron while there must be complete freedom from organic materials such as paper straw varnah, etc, and finally means must be found to keep the apparatus below the temperature at which the chloride would attack the iron Since 1907 the German pioneers in the detinning industry have found a way of meeting all these conditions however, and of carrying out the operations under a varying pressure so that the chlorine is forced into every part of the mass of tinned scrap, and accord-ingly the electrical detunning has largely ingly the electrical detunning has largely been abandoned in favor of this method A conspicuous advantage is the large

Within very recent years there has been within very recent years there has over a tendency to return to the alkah treat-ment which is instorically the oldest of all. The scrap is cleaned carefully and placed in a well-heated solution containing a considerable excess of free alkah and salt-

Recovery of Tin from Tin-Plate Scrap peter or other oxidizer. After boiling, Ab the war has progressed the price riamant of sods forms in crystals, which to fit the advanced to levels baselosifur. Hought impossible Accordingly, the solid progressible Accordingly, the solid progressible Accordingly, the solid while attention has always been directed. then extracted from its connection with the soda while the alkali itself and the saltthe some wante the attain their and the salf-poter are recovered for use again and again, with little loss. The fact that the process is a circular one is the advantage which has led to its recent extensive reintroduction

#### Toluol and the Gas Industries

THE importance of high explosives in the war has been amply demonstrated Nearly all types of explosives are used in some way but trinstrotolool because of high power and great stability is one of the preferred members of the class. It is used alone and in combination with other explosives especially for naval use it is used slone It ause its great stability permits unusually long storage of the shells before use On account of the great demand thus a tiel there has grown up also a large thus it uter there materials from which demand for those materials from which it is mad and especially for toluol. This latter sul stance finds numerous applica-tions in the chemical industries but above all else it is used in the manufacture of

Although toluol occurs in coal tar and is comin it is spoken of as a coultar product there is really to be found in the tar only a small percentage of the total toluci originally distilled from the coal Most of this constituent remains in the gas. This toluol together with bensol the xylols and toluol togeliles with bensol the xylols and other related hydrocarbons can be re-moved from the gas affording what is known in its crude state as light oil. This light oil has not heretofore usually been removed from coke-oven or city-gas sup-plies because of the relatively simall com-mercial domand for its constituents. The process for removal was well known how-ever the prin ipal one being the washing of the gas with a petroleum oil in which they were subsequently recovered by distillation

Privious to the declaration of war in 1914 the production of toluol in the United States did not exceed 500 000 to 750 000 gallous per year Most of this came from coal tar distillation but smaller amounts were prepared by refining the light oils removed from cok oven ga few plants At once after hostilities opened the demand for toluol increased greatly and it became evident that the common sources of this material would not meet the new commercial demands. As a meet the new commercial demands. As a consequence a large increase in the recov-ery of toluol from coke-oven gas immedi ately followed and more recently the recovery of this constituent from city gas supplies has also resulted

To give an approximate idea of the scope of the industry thus developed one need only compare the small output of pure toluol in 1912 and 1913 for which years it was approximately 500 000 gallons, with it was approximately 500 000 gallois, with the estimated output for the year just past (1918), during which period it is hoped that the output will have exceeded 20,000,-000 gallois Practically all of the increase has been possible because of the recovery of toluol from coke-oven gas and

supplies he removal of toluci, bensol and other light oils from the gas eauses a reduction in both the heating and the lighting value of the gas. Therefore city gas plants which are required to maintain certain qualities of product have found it necessary to counder the influence of this by-product. industry upon their operating practice in order that the recovery of the constituin order that the recovery of the constitu-ents in question may not reduce the quality of the gas supplied by them below the legal standard. In some case changes in operation practice are possible in others resumed, and the proposal of the others resumed to the proposal of the light of the beautiful of the proposal of the in thill other cases modification of stand-ards has been found desirable, especially (Continued on page 229)

more and more widespread

The Bureau of Standards has found that this entire development comes within the scope of its activities and has kept its finger continually on the pulse of the tolkid and gas industries. From time to time it has published reports and papers on onaspect or another of the situation, and it crystalized to make possible the publication of what for the present at least ranks as a final summary of the procedures for recovery of toluol from gas. This paper is available for distribution to those interested and may be had from the Bursau in Washington It should be applied for under the title 'Technologic Paper No 117, Toluol Recovery

#### Emigration After the War

A MONG the economic questions which will become more important as peace comes nearer is undoubtedly that of emigration There will be a gr for labor to rebuild all that which has been destroyed even after the armies of millions have been demobilised and returned to productive work, and at the same time the trans oceanic countries need of immigra-

tion which during the war has almost stopped will be reawakened with renewed strength There will be a strong drawing on the neutral countries especially, which have been spared their populations, and t is therefore necessary for these country to take timely measures to prevent such harmful results according to the Seensk Handelstiding of Stockholm Sweden

The Dutch press has given a summary of easures already taken in this direction by the neutrals as well as the warring countries In May there was started in (comany the Reichsstelle fur deutsche Auswanderung und Ruckwanderung to work for the return of Germans from foreign countries and at the same time to guard and replace their former properties In England the Government has already started to make plans for the returning soldiers and their families in Canada Australia New Zealand and South Africa (anada Australia and New Zealand have siready placed great tracts of land at their disposal and so his South Africa, on a smaller scale lengland has submitted an emigration law for second reading. It works against emigration of labor from I agland to other countries and also provides for certain restrictions on emigration to the columns

In Switzerland is the Auswanderungsamt which controls the work of emigra-tion promoters. Austria Hungary like Germany counts on the return emigration Opinions have been expressed in favor of giving them land maximuch as most of the emigrants from Austria-Hungary have been

Italy can probably count on a balance labor | the former seasonal emigration of land laborers to surrounding countries, on which a large economic profit has been based will presumably be resumed. Considering the great war losses there will surely be a few years halt in the former large enugration to North and So

Because of the present good relations between Italy and France it is quite possible that France will be fortunate to receive the seasonal emigration of Italian land laborers. The I rench emigration was not large before the war. On the was not large betor the war On the contrary there was considerable emigra-tion to brance from Italy, Spain, and Belgium Regarding Belgium, there will undoubtedly be a strong check against emigration from that country, inserench as no country will be in as great need of man power as Belgium

On the northern European confidence

by the other European countries which will need a maximum of skilled labor but whi need a maximum of same into but also by America, where extensive estab-fishments have already been started for the purpose of encouraging immigration, concludes this Swedish contemporary

#### Shipping Subway Cars a Thousand Miles on Their Own Wheels

T is used to be the practice to ship elecars intended for metropolitan railways, on b waiting for it

job watting for it.

So when it came to shipping the subway
cars intended for New York city a new
subways the expedient of shipping these
cars on their own wheels over a distance of
one thousand miles was resorted to. Out of 477 subway motor cars 307 motors and 140 trailer (ars were shipped from the car building plant near Chicago, to New York city Later 30 cars were also sent in the same manner When these cars were

the same manner When these cars wer ready for shipment, inspection was made by the subway s inspection department In shipping the subway cars, they were first assembled in units of five, and M C B

first assembled in units of five, and M C B drawbar had and steps and grab handles were installed on the first and last care of each unit in compliance with the Interstate Commerce Commession a ruling All ears were capupod with special brake ragging autable for shipping behind standard steam and the compliance with a special consistency of the compliance of the complian that in case of a breakdown, a five-car unit tent in case of a oreaction, a process mine could be dropped off at any terminal if temporary repairs could not be made The side tracked unit could then be atsached at the rear end of the next shipment

Thirty cars were shipped in one train from the car plant in charge of a rep tive from the subway company car contained one mattress, one pillow, and two blankets for his use For emergand two bullets for ms use for emerg-ency purposes there were earned in the last rer 25 journal brases, 10 gallons of journal oil one pail of grosse, one pail of saturated waste and one packing ron it was necessary for the messenger in charge of the train to supply himself with

rations for a period of about four days
When the subway cars were ready for Which the subway cars were ready for shipment the car builders took them to Burnside Chicago and they were thon transferred to the Belt Line Railroad of Chicago which in turn transferred them Chung which in turn transferred them to the lake Shore Radroad at South Ching There was sometimes a delay of tw lve to twenty four hours before care of the 1st to twenty our abun source can could be transferred to the Lake Shore Road loe to the blocking of the road When cars were finally turned over to

the Lake Shore Road a crew consisting of one enginer two brakemen and one conductor was called by the yardmaster to take the train to bikhart, Ind the first stop between Cheago and New York, where the cars were inspected and all journals lubra ated

At each division different crews took At their division different crews cors charge Between Chicago and Cleveland, an average speed of 20 miles per hour was maintained, while between Cleveland and New York city, the speed was 25 miles Upon arrival in New York city at the

Highbridge Yard, all cars were thoroughly inspected to see if any of them had been damaged in transit, in which case the rail-road company was held responsible

The average time from Pullman, Ill to Highbridge New York, was two to three days The distance is roughly 1 000 miles On occasion it has been necessary three on occasion is has been necessary to replace a journal brase on the road from Chuago to New York due to overheating, but as a general rule no trouble has been

our as general rise no trouble has been experienced in shapping subway carr on their own wheels over the great distance. Cars are stored at Highbridge yard until they arrive at the construction shop of New York's Interborough system. They are thou reheved of their temporary brake figure, store explained and rigging, steps, grabhandles and drawba heads, and these accessories are returned to the our builders by building

## Are You Going After Foreign Trade?

If so, are you sure that your inventions and trade-marks actually belong to you in foreign markets?

Unless you avail yourself of the right to acquire foreign patents and trade-mark registrations, you may find that another has preceded you and has actually appropriated your inventions and trade-marks and obtained legal ownership thereof, whereby he can bar your goods from foreign markets Such a proceeding is permissible under the laws of many foreign countries

Many have lost their markets in certain foreign countries by overlooking this fact

Many of our clients are preparing to extend their business by seeking patent and trade-mark protection in foreign coun-

# GMC Trucks at Pre-War Prices

The announcement of a reduction of \$200 in the price of the GMC Model 16, 3-4 ton truck, is good news to truck buyers.

Back of this action is an interesting story of war production of which little has been told

The General Motors Truck Company is one of the largest builders of motor trucks. Prior to the close of the war fully 90% of its production was for the government.

But it was building **GMC trucks** for the government—**GMC** models selected by the government.

The enormous government demand made extensive improvements in manufacturing facilities necessary. The capacity was doubled and trebled and every possible efficiency measure adopted.

With war orders completed, we have proceeded without factory changes or alterations in design—we are continuing quantity production.

We are making the same high grade trucks that the government selected and standardized after they had been proved by years of government service and had successfully stood every test, under official scrutiny.

The reputation that GMC trucks have made, not only in government service, but among the best business concerns throughout the world, is one we are proud of.

We cannot afford to, and will not cheapen our trucks in any particular; we constantly make them better when we can.

But we can and have reduced the price on all six models of GMC trucks to the lowest point consistent with their high quality and a legitimate manufacturer's profit.

#### Relative Efficiency of Bridge and Tunnels

MOSI persistent and curious fallacy which keeps cropping up in the discussion of the relative advantages of bridges and tunnels for the Hudson River crossing is that of the greater economy of tunnels As a matter of fact measured on the basis of carrying canacity tunnels cost a great deal more than a bridge We have no particular interest in bridges as against tunnels but we have a very particular interest in the truth and it is most unfortunate that this error should have become so deculy rooted and far spread

Any two rival systems of transportation must be judged when we are considering their cost alone, on the basis of their (apacity and since the bulk of the traffic in these days is trolley and train traffic it follows that the basis of comparison must be that of the number of tracks provided. Thus the Pennsylvania tubes leading to the 33d Street Station accommodate two tracks | The proposed North River bridge over the Hudson River will provide 14 tracks or seven times as much capacity the North River bridge will provide also wide roadways for a very heavy automobile and motor-truck

The scheme proposed by Gustav Landenthal and described the where in this issue, calls for a helt line with two crossings of the North River one by bridge and the other by tunnel and the author of the scheme who is by no means opposed to tunnel construction, estimates that the capacity of the North River budge would be equal to that of 18 separate tunnels which would cost in the aggregate 200 inilion dellars as compared with the cost of a North River bridge of equal capacity of only 75 million dollars

Another persistent though less frequently stated fallacy is that of the relatively short life of a bridge as compared with a tunnel One pronuncial citizen of New York who certainly ought to hav known better recontly stated that, whereas a tunnel is indestructable, a bridge is subject to constant and i spid deterioration so much so that within a comparatively short time every part of it would have to undergo replacement. As a matter of fact there is no reason, except that of human negligence to prevent the inhabitants of this city a thousand years from now traveling over let us say the Manhattan Bridge across the East River-not a Manhattan Bridge renewed but a Manhattan Bridge containing practically every identical ton of material, at least so far as the main elements of the bridge are conserned that xists in the structure today. All that is necessary is g ad weather proof paint, a conscientious inspection and the freeing of ongineering works in this city once and forever from the destructive blights of political interference and graft

So great is the mass of those long-span bridges that their sponsors are never worried by any theories of the so-called fatigue of metal. The proposed North River Bridge, for instance, will nover in any part of it be stressed within speaking distance of its elastic limit, and with carrful inspection and painting, the structure, once erected will stand as a supreme monument to the present age of steel construction not merely for the time of our children and grandchildren, but for uned-at centuries to com

It should be understood, of course that this perpetuity does not apply to those portions of the bridge that are ammediately subjected to direct contact with the traffic such as asphalt or plank roadways steel rails and ties But excepting those, which in the aggregate form only an insignificant portion of the mass of the bridge, the rest of the structure, with a little human care, should be as lasting as the work of those far distant engineers who piled up the pyramids of the Pharacha

#### The International Institute of Agriculture

N January 3d the cables announced the death in Rome of David Lubin the founder of the International Institute of Agriculture, located in that city Although David I ubin was an American citizen, a Californian, the brilliant constructive work done by him in the foundation establishment, and progressive development of this remarkable enterprise is ess widely known and appreciated in this country, perhaps than in Europe It was in 1905 that this vast project was initiated with the support of the King of Italy Its success is borne witness to by the fact of its rapid growth and extension to include no less than fiftysix countries among its members Its object was th creation of a world-ambracing organisation for the study of every phase of agraculture The questions involve demand the study of the most favorable conditions with respect to the production distribution and consumption, not only of bread and of most and of the cereals and the herds and flocks from which these great food staples are derived, but also of the wool the linen, the sik and the leather which furnish the clothing of mankind, of the coffee, tea, wine, eader and beer which humanity craves, and of a thousand far-flung products yielded by the bountiful earth for man a comfort, luxury, or

Included in the general problem are first the technical problems having to do with machines on the one hand and with fertilizers on the other and therefore demanding aid both from the natural sciences and the applied sciences secondly, the economic and social problem concerned in association and cooperation mutual inter change of information, credit and senstance in general, and, finally, those of the agraman policies principles, and laws current in various parts of the world

The Institute, in fact, forms a vast clearing house for the exchange of mutual information and aid with regard to agricultural matters between the 56 government which form its members and share its expenses, and no better proof can be given, perhaps, of its vigorous growth within so short a time than the fact that even the Great War was not able to shatter its structure, or notably curtail its activities. It has steadily continued to achieve its objects as stated in Article I's of its Constitution, to the effect that "The Institute confining its action to the international domain shall (a) concentrate, study and publish as soon as possible all statistical and technical or economic information concerning both animal and vegetable products in the different markets of the world (b) communicate to its members, likewise as promptly as possible, all such information, (c) present upon occasion for the approval of governments, the measures to be taken for the protection of the comm interests of agriculturists and for the betterment of the conditions under which they work and live"

The Institute is divided into bureaus or sections, which issue valuable publications including three monthly bulletins, dealing respectively with agricultural information statistics, and social and economic institutions. two annuals, relating to agricultural statistics and agricultural legislation, prefaced by a résumé of world legislation, three publications of seasonal or annual a with respect to the statistics of cereals, the food supplies for domestic snimals, and fertilizers and, finally, a periodic bibliography of agronomy and a large number of monographs upon special questions

The Institute has an annual moome of about \$180,000

including the \$60,000 grant by the King of Italy, and

the subsidies from the government sometimes. The has enabled it to obtain an admirable segritories, the chaf feature of which is its library, which consists 70,000 volumes even five years age, besides form of recent of some 2,660 papers and periodecals from all the world Its work is facilitated by the possession its own post office and its own printing establish both housed in the same palace which abelians Institute, which also contains suits of rooms for visiting delegates Since only governments are eligible as mes bers of the Institute private organisations or societies wishing to correspond with it must do so through their respective governments

#### Reconstruction and the Industrial Engineer

HEN we joined the war against Gerk aggression, two years ago, we realised that VV we were entering upon a vast manufacturing undertaking, the greatest the world had ever seen Our men in the field could only win as they were supported by the men back home in the machine of the more efficient that support the sooner would visit be achieved and the less precious blood would be shed Consequently the manufacturers of the country was called together to lend their council in building up the huge industrial organisation. The Council of National Defense, thus formed, early awoke to the fact that its membership included no industrial engineers, and also to the fact that there was no national organization of such engineers An appeal for help was sent to the Western Efficiency Society, one of the most active local societies, which was about to held its annual convention in Chicago The response to this appeal was the formstion of a national society known as the Society of Industrial Engineers

The first duty of this society was to aid the Govern ment in the tramendous industrial problems with which it was confronted and its services were of highest importance to the nation

The Society of Industrial Engineers is meeting next week in New York to study problems that have arise since the eigning of the armstice There is no doubt that the reconstruction period will make greater demands upon the services of the industrial engineer than even the period of feverish wartime menufa-During the war the one all important impelling force was production Everything had to be sacrificed for production and methods were employed which could not be used in time of peace by a commercial concern Industrial engineers had to adapt themselves to war conditions and modify their systems to conform with unusual circumstances There was some bungling and some very mefficient work on the part of novice posed as real industrial engineers. But on the whole the experience was of benefit to all parties Manufacturers learned to appreciate the services of industrial engineers They found in them real "coordinators who worked to effect real cooperation between employer and em-ployee The latter began to lose his distrust of the efficiency engineer and, to understand him better, and the industrial engineer himself learned minds about organisation and management on the one hand and the cessity of studying the requirements and interests of

the indurdual worker
On another page we publish as settlet on Industrial
Democracy and Engineering in within these experiences
of the war are discussed and the sent aims of the industrial engineer are outlined. If his aid was insided
during the war his services are over more indisplaceble
during the war his services are over more indisplaceble
during the war his services are over more indisplaceble
during the war his nervices are going through the ingringpented of readjustments. The public has been adjusted
to the worth of industrial angineering, and the industrial regimeer, himself, has received a most realizable
education from his caparinances in the wars, to dept he
is better fitted then swer belowe to said the anginger in
the perplocing mechanical said industrial pupilsme
which are now confronting him.

#### To Our Subsiribury.

OUR scheetbers are requested to note the sightested date that appears on the wratpens established to copies of Scatterage Assuments. If they will sight to their received orders at least two weeks point for la-dest of superation, it will said us greatly in imposition, them offsients cervise.

#### Naval and Military

"She 14-sizen "Aslincourt" Net Popular.—The Bujish battleskip "Apiacourt"—formerly the "Rio de Janebee" building for Braul and taken over by the Brijsh when the war opened—a notable for the fact that his has no less than even, two-pun turrets, mounting a total of fourteen 12-inch guns as her main battery the protection of nne laches of side armor is residered by three geotective decks, 17 main builcheads, and 305 webs-dight compartments The ship, according to The Hugsneer, is a type quite alien to British naval ideas, which run just how to fewer guns of heavier calibre, and in spitts of her formidable armsment, she is not a very popular skip.

Government to Take Over Cape God Canal —The tenerary of War, the Scowrary of the Navy, and the Scowrary of Commerce were requested to discuss the advisibility of sequinng the Cape God Cana for the Frderal Government, and they unanimously concluded that the transfer was destrable The Scowrary Own, after elaborate studies as to the value of the Canal made by the Englascing Corps of the Army, offered the Canal owners the sum of 48, 150,000, which they declined to accept Consequently, the Secretary has asked the Altornay-General to begin condemnation proceedings and report the facts to Congress It will be agreed that the strategic value of the Canal, providing a pracially continuous inside water routs from Boston to New York for paval ships, fully justifies its acquisition by the Théedral Covernment

The Navy and the Merchant Marine — Discussing the interdepadence of the navy and the merchant marine. Vioc-Admiral Albert E Gleaves recently designated the navy as the backbone of our as power and the merchant marine as its nerves and smews. He stack his belief that navy and merchant narme seamen should be paid on the same scale cared for with the same scale cared for with the same thoroughness, and subjected to the same designine. In 1914 the total merchant tonnage in the world was about 0,000,000 tons. The war, thirty through submarine prizely, destroyed 15,000,000 tons, and the new shipping constructed amounted to about 1,000,000 tons, leaving a whorage of 4,000,000 tons in ordividual displacement and totaling 30,000,000 tons. The over 1 of the first its extension of the first its marked at four billion dollars—10 times as much as the

Later Particulars of "Hush" Ships -The latest ent of dimensions regarding the so-called "hush" ships built for the British navy during the war, indicate that their dimensions, speeds, etc., as published during the war were greatly exaggerated. Thus, The Engineer gives the following dimensions for the battle-cruisers nown" and "Repulse' Length, 794 feet, beam, 90 feet; draft, 30 feet, normal displacement, 28,500 tons and for the celebrated trio "Furious," "Courageous, and "Glorsous," the dimensions given by the same authority are Length, 786 feet, beam, 81 feet, normal draft, 28 feet, and displacement, 18,600 tons After "Furnous" was changed to a seaplane carrier, auplanes had no difficulty in landing on her deck after nturning from a flight She is credited with 18 torpedo tubes and with 90,000 horse-power for a speed of 31 knote, which, we are told, was very greatly exceeded in actual service.

Listing Ships for Range.— In the annual report of the Berment of Ordonne, Admiral Earle states that the turnet machinery on the "Ministipp" has been tested and concessfully freel, with the abil plant of 1/5 degrees, which, with the guns at their manmum elevation of lo degrees, gene the calculated range. This increase of range by listing the ship has been practiced excountfully by allied ships in various congenumms of the war, and particularly in the long-range hombarderiment of the German fortifications at Ecobrugge and Ordon We understand that he our lates thereted designs the mounts are archanged by give a maximum elevation of 30 degrees, which of occesses, in any but vary acceptional elevanciances, wealth chybric when heart her acceptant for inting the ship is againful group to the secondary for the part of the procedure, such this gam, apposition to be an oriontification of the grant of this gam apposition to be an oriontellaria, such this gam, apposition to be an oriontellaria, such this gam, apposition to be an oriontellaria, such for these companions in the refuse against the special part of the such as the companion of the refuse against the special companion of the special compa

#### Electricity

Wireless Between Greek Britain and Australia —
The Dauly Mai reports that on September 22d last
direct wireless communication between Greek Britain
and Australia was established when two measures from
the Premuer and from first Joseph Cook were received by
the Amsignanted Wardees Company of Australausa
from the new station at Carnar It is stated that from
the message received at 8 Sydney were perfectly clear
and distinct, despite durect transmission over 12,000
mules is

Heating Rivers Electrically—With the employ must of women in many forms of work heretofore considered too heavy for them it has been necessary to modify the equipment and form of work in numerous instances. Such a case is the heating of rivers by electricity in charge of women instead of portable society forges operated by turning a heavy crank there society forges operated by turning a heavy crank there has been introduced an electrically-include florgy which is clean, simple to operate, and randily portable. It will heat a standard rivet in 30 sec ord s

A New Form of Variable blectric Resistance.—A recent German patent taken out 1 y 1 Straser relates to a modification of the type of resistance in which an iron enclosed in hydrogen is a strought by a heating cold As a well known, a small change in the current flowing through the basifing cold can be made to cause a very considerable change of resistance in the iron, and such resistances are claimed to have special applications for use with machines of very variable speed. The novelty embodised in the patent consists in making the heating cold of a material with a negative temperature conflicient. In this way, it is punted out the beating cold of a material with a regative temperature conflicient. In this way, it is punted out the beating on the rore wire resistance, and the anneativeness of the apparatus is accordingly increases.

Simple Resistance Units — To a British firm goes the credit for introducing a very sumple, type of resistance unit which possesses numerous and important advant ages. The virce of strip member is supported on a angle rod passing through the center section of each leg of the signaged wire or strip. Among the special advantages capacity, small weight for a given capacity absolute capacity, small weight for a given capacity absolutely markee the distribution of the signal ways of the signal surface and small bulk of metal they sool virt quirk) they are absolutely unaffected by vibrati n or jolts units can be run red but without danger of assigns repairs can be effected on separate units tapping can be taken off anywhere along the center cleamy the number of units being small compared with a grid resistance of equal appacity, there are not many joints to cause trouble

Electric Welding with Covered Electrodes -According to E G Rigby, speaking before the l'ngineers Club of Philadelphia, welds made by plain iron or carbon rods as electrodes are frequently deteriorated by pitting and oxidation, resulting in britleness and porosity and breaking up of the metallic structure Oxidation renders a joint peculiarly hable to corrosion, which in shipbuilding work is of the highest importance. In the covered electrode process the electrodes are surrounded by a covering of blue sabestos yarn which in fusing acts as a reducing agent, and by excluding the atmosphere from the fused metal effectually prevents oxidation of the deposited metal The yarn is coated with silicate of Na, Al, or the like to vary the fusing temperature of the asbestos yarn. The electrode further has combraed with it a small quantity of metal capable of emerting a strong reducing action, such as Al in the form of a fine wire incorporated in the covering. In operation the are is formed by touching the work with the end of the electrode held vertically, after which the electrode, still in contact with the work, is dropped to an angle, when the arc is immediately destroyed owing to the covering passing into the igneous state | I he action once started the electrode melts at a uniform rate so long as it remains in contact, and leaves a seam of metal perfectly diffused into the work, the sovering material forming a slag which floats and spreads over the surface of the weld as it is made. Steel plates or castings can be readily out by dipping the electrods in water and with a relatively high current applying the point of the electrode to the piace to he cut and marriag it quickly up and down through the thickness of the plate, allowing the molten metal to drop

#### Aeronautica)

The German Air Service —The Para newspaper Szeszer in an article on Criman station states that on July lat of the present year German station states that on July lat of the present sear Germany as after a cluded 1.50 shearer machines 300 protect map late 1.020 reconstituents as and 1.55 combers. In 1.020 reconstituents with the same state of the property of the state category included 1.2 mants. Germany loss 500 machines between July 1.61 and N. xemirr 1.14n and chieves 1.700 under the tree of the crimative leaving only 800 machines in with oil which are state and range finding arcraft. This state of affairs was the Parelson effectually prevents any thought of ugers on from the

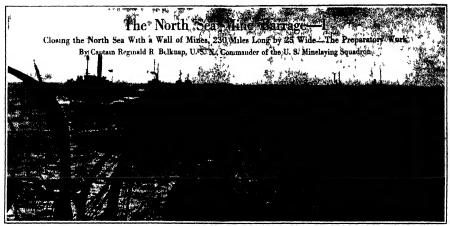

Bletot's Commercial Planes —I rom our Birtish contemporary Piety we learn that the Biront works are also interested in commercial avastion so much so in fact that two new four-sequence arrelates of large dimensions are now nearing completion. These machines it is reported will be especially studed to acreal transport in the French colonies where roads are none too good and rallways non-existent. In auth cases the arrelation will link up by postal air service one colony with another and with the capital while numerous other spheres will doubtless be found in which the large weight-carrying airplane will be of inestimable value.

Waterproofing Alrijane Propellers with Aluminum Leef — A waterproof coatum for surplane propellers, which incorporates thin aluminum leaf in the finish was developed by the Forest Products Laboratory at Madison Way, and placed in production by the Wat Department. The process is practically 100 per cent effective in preventing absorption of water particularly in the storage stage. A I rench authority states that 30 per cent of the French propellers produced are rejected by the pilots mannly because they are out of balance. That difficulty is due largely to unequal absorption or distribution of mosture and can be greatly reduced by an effective waterproofing coatine.

A Giant Farman Machine -The possibilities of post-war commercial aviation are being realized in all the leading countries It is reported that a new commercial airplane has just made its appearance at the Farman works at Boulogne-sur-Seine The new machine, which has been christened the Golisth, has made its official flights piloted by Bossitriau It is of the F 60 type and is capable of carrying 20 passengers. It is said to have a speed of 160 kilometers (about 100) miles) an hour, and is able to make a continuous journey of 3 000 kilometers (about 1 865 miles) littled with floats the Colleth is expected to be able to undertake the trans-Atlantic journey For a start the new mahane will probably be employed on a Paris-London passenger air route

The British Air Force —At the close of the war Great British led all nations in the air. The British air force lought on more fronts than any other nation and its successes were therefore proportionally greater. In Aquat, 1914 the British naval and military air service together mustered only 285 officers and 1853 men of other ranks. In November, 1918 there were 80,000 officers and 284 000 men. At the outbreak of the war forcest British and 166 airplanes, 45 seaplanes, and seven airplanes, while at the close of hostilities she had 21 000 sirplanes, and 163 airplane. Bendes, there were 25,000 airplanes and 163 airplane. Bendes, and 55,000 airplanes and saplanes being built and 55,000 airplanes engines under contract. The womens Royal Air Force which was not in existence in 1914, numbered at the close of hostilities 23,000

Testing Methods Which Preclude Accidents -On account of the difficulty in securing suitable pieces for the manufacture of larger airplant parts and the necessity of conserving material several series of tests were conducted at the Forest Products Laboratory at Madison Wis on built up beams and struts of various designs and also various types of splices. Results of se tests were used in preparing Army and Navy specifications for laminated and spliced beams and laminated struts Two simple non-injurious methods for determining the strength of struts have been developed and further tested for inspection work, which it is thought will considerably reduce the number of rejections under the standard method. The tests are made on full-sused specimens every strut used being subjected to the standard test which is more sovere than any working load could posmbly be

U S Minelaying Squadron at Sea, on route to the great minefield, North Sea, September, 1918

' SORRY not to be able to say good-bye personally to all your good fellows who have done such excellent work was the Christinas message from Rear Admiral Clinton Baker R N head of the British mining Admirat (1800) issaer it is need of the Britain mining service which only rated with our in Jaying the great mincheld barrier against submarines stretching from the Orkney Islands to Noway \ \text{chi in Admirat Sime address just be fore the American Minclaying Squadron left Portland I ingland for him, be said After we came into the was well signed a mine built it equipped the mine layers sent them over to this side and planted mure mines in less space of time than any nation in the world ever thought of doing before—one of the finest stunts the Navy has accomplished on this side

Reducing a new invention to practice in a few months is no small problem especially when it is a mine to be planted much depr and wer bottom 100-fathoms deeper than ever before yet this had to be done to meet the enemy s submarin campaign the most seri us menace to the cause of America and the Allies Along with hastoning our distriyers into the war zone our Navy Department advocated other active incasures essentially offensive to block up the Crman Lucia

Towards such an end British destroyers had been con stantly planting imms near the Cerman c set but they could not prevent the circum from sweeping clannels through Beades sance the Nekagerard could not be closed locally without violating the neutral waters of Deminark and Nouway the situation needed a barrier which wind melude the Nagerard and also be too far from the German bases for suppress in force. If only half successful such a barrier would still be more effective gainst submarines then merely buring them at large Yet it called for such numbers if min s to

provide and plant in a short time as to make the undertaking appear impossible

Among the countless war inventions pouring into the Naval Bureau of Ordnance upon our joining the war was one which unsuitable in its original form contained a device that was adaptable to the firing mechanism of a num with great possi-bilities if so applied especially against submarines. The peculiar virtues of the new mine were extreme sensitiveness and twice the rea h of any other name -both qualities invaluable. The result was briefly that the Bureau of Orda and could in July 1917 assure our niced authorities that in urging the closing of the North Sea they might at the same time offer the means for

its accomplishment

To convert the skeptical 1 to ardent advocates of the new mine to develop and test some of its features to outline plans and settle preliminarits all took time but on October 29th 1917 the order was given to proceed The terms impossible

and 'foolish were freely applied to the scheme. Co. tracts for 100,000 mines would have to be let, and ter of millions more spent outright both here and in Great Britain based on test of the mine only by parts since a complete new mine did not yet cast. But in spite of the several elements of uncertainty, the undertaking had unqualified approval of everyone in authority from the President down

Briefly the project was for the United States and British mining forces to cooperate in establishing a mine-field barrier across the North but I etween Scotland and Norway The minefield would measure 230 miles long Norway The minefield would measure 230 miles long by 25 miles average width, consist of 70,000 mines, in systems each comprising one or more lines of mines near the surface other mines deeper and yet more, deeper still so as to bar or imperit the passing of any vessel whether on the surface or submerged

Bases for assembling the American mines were to be prepared in Scotland, at Inverness and at Invergordon 20 miles distant, on Moray 1 brith above Aberdeen (onsiderations of navigation of shorter exposure to submarines and of saving the carriers time dictated the dicusion to unload all cargos of mine material from America a the western terminus of the Caledonian Canal and at kyle of Loch Alsh apposite the lale of Skye The cargose would be transported across Scotland by canal motor barges and the Highland Railway. Limited capacity of these transportation routes mecessitated having two assembling bases for our Mine Squadron instand of one These bases were constructed by the British Admiralty, Captain O & Murfin U S N, being the supervisor on our part and in charge of the bases when completed Most of their machine tools, diction to unload all cargos of mun material from

furnishings, and other equipment were sent from the

Secreey, as well as haste, necessitated dividing the Secreey, as well as name, necessitation dynamic are construction of the mine among 500 contractors and sub-contractors. Paris manufactured in different places were sent to a third place for joining, and all were finally were sent to a third place for jounng, and all were finally sent to Norfolk, Vs. whence they were shapped to Sociland where the mines would be assembled complete for the first time, ready for planting. The mine spheres were tharged with high explosive at a plant near Norfolk, containing large steam kettles, which poured 300 pounds of molten TNT into each sphere. In this quiet corner the sallow worked in constant danger from fire and the poissonous funces of the molten explosive. Several were senously overcome and not dead from the effects, but eriously overcome and one died from the effects, but the rest stuck to it through the long hot summer months

To carry the mine material over, small steamers were closery the mine material over, small steamers were rhosen to minimize the effoct on the operation is case of loss. One the Lake Moor 'was sunk by a submarine in April with 41 of her crive, making almost the only loss of life in the whoit operation. They had capacity of 2000 to 4000 tons and carried 1200 to 1800 mines, beedes stores of various kinds four minelaying squad-ron and bases were supplied almost entirely from America obtaining abroad little more than fuel fresh meat and vegetables. There were 24 of these carrier steamers constantly employed, from February on; two or three sail-ings every eight days, all under the management of the Naval Overseas Transport Service

Naval Overskas Transport Service
Towards making up a squadron large enough to
undertake the barner, we had the old crussers San
Francisco
Inyers in 1911 and 1915 In accellent condilayers in 1911 and 1915 In accellent condiprepared by the condition of the condit mentation The manufacturing output was soon to be 1,000 mines a day, and the was son to be 1,000 mines a day, and the round trp for one manishing operation could be estimated at not less than five days—coaling, senbarking mines, out and back, ready for the next operation. Hance, a squadron with a capacity of 5,000 mines would be needed to keep up with the supply and thus plant the barrier as soon as possible of the contract 
Eight merchant steamers were c Eight merchant steamors were converted to carry mines on me, two, or three decks, making, with the original two, 3,700 mines capacity, thus providing a good margin for contungencies. Mines are extract on tracts of steel channel bas, placed with the finances inward. The small wheels on the box-like mine ambier tread on the box-like mine ambier tread on the lower finance, while the upper fining serves as a chock against the manes 'upscribing in as a chock against the manes.'

Transferring mines from trucks to harges

heavy rolling at sea. The mine spheres are secured fast on the anchors, so that mine and anchor go overboard together, the release of the anchor taking place after they reach the water

our largest vessels, there were two long tracks on each aide of the launching k, which was the first covered dec tieck, which was the first covered deek, the same on the next dock lower, with shorter tracks in between at the ends, and similarly more below. On each dock there were several cross tracks, with a simple form of turntable at each intersection for convenience in leading the ship and to provide alternative routes for getting the mines out in case of a jamb.

Two launching ports bour 10 feet. Two launching ports on the step of the router, one on either side of the rudder head and about 20 feet of angle track led from each

about 20 feet of single track led from each

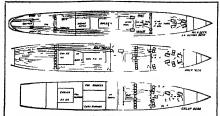

port, forward, to a switch connecting with either of the two long tracks. Steam winches were installed on all decks to haul the mines along in trains or feets of 30 to 40 Each nane with its anchor weighs 1,400 pounds and as its wheels are small it takes power to give the long trackful of mines the slow, steady movement towards the stern which is necessary to make the

planting interval between successive mines uniform
At the stern just miside the launching ports were
mine 'traps, which held one mine at a time on a slope Outboard, projecting about three feet beyond the ship s skin plating, the mine track curved downward, ending at sin pistung, the mine track curved downward, ending at de dageess Upon throwing lie trap lever the after jaws would open and the mine, of its own weight would frum down the elope over the curved quadrant and drue overboard. At the same time the trap a forward jaws would done preventing more than one min slipping through at one opening. The mine track near the trap was higher than the rest the up-prade serving to check the mine a surging sternwards while mining in a head set. Control throughout the mine decks was offered to

Control throughout the mine decks was effected by an electrical system of signal lights and gongs. At a contral point, near the launching ports the mining officer could communicate with the captain ou the bridge, by telegraph indicator and voice tube and could signal to telegraph indicator and voice tube and could signal to topo start, or reverse any min. Bitations were provided along the tracks, so that sentines, in case of a jam or anything wrong could signal to stop the winch con-cerned and also to "walk back, or 'all elear again. To enable the entir load of a ship to be planted in one continuous string elevators were installed in the forward part of the shape so that as the mines on the taumching

deck moved sternward those on the lower decks could be hauled forward to the elevators and sent up to be planted in their turn. The elevators were hydraulic or electric six in four ships four in two others. All were the Otis Company s standard platform type each lifting two mines Company a standard platform type on the transat a time in 20 seconds the round trip. The transact a time in 20 seconds was ample for the maximum rate of mine planting even if half the elevators should become disabled but during seven months in all kinds of weather, of 32 elevators only one failed—once
The experience of the British with elevators had not

been encouraging and their were other points where we took a new departure and succeeded. They had trouble from the tracks closing or opening with the working of the ship in a staway, thus binding the mines or allowing them to drop between tracks and jamb Our design of tases to drup netween traces and pann. Our design of a steel cross-tie mounted on a wooden bolster obvisted any such trouble, although our tracks were of much lighter section than theirs. Then there was the question of switches. Nome one suggested a parallel motion, privoting each switch rail at the single-track end,

Mineplanter "Roanoke," showing mine tracks elevators and turntables

which made our switches incr dilly simple and effective The aim throughout was to make the imming installa-tions substantial enough to cudare hard usage yet simple to provide power whire power was needed including ample reserve for temporary disablement Experience in our Mino 1 r living the preceding three years had taught that il riness intelligence and judgment of trained mine crews made the less depend ence and that, where kinky, sprii 5) wire rope and heavy lumbering mine weights were concerned automatic or complicated devices were dang rous

In brief the mining installati i mi i irganisation pro

The North Sea barrage containing 70,000 mines

vided for a well regulated m vn cnt of the whole mass of mines, in such a way that the ships trim was preserved as long as possible vial it in plut may sent on without interruption. The plus without interruption the flowstonic planted 675 n r s at 11½ seconds interval without a break, and on a litter oversoon the '4 anomeus planted a string I soft mines 43 miles long one every 15 seconds in thousand 10 miletter output long one every 15 seconds in thousand 10 minutes the minestysees other arrangem sits were very good though ventilation was sear if for lack of sufficient

blowers while fitting out. The batteries nowers while nitting out the batteries were small one five inch and two three inch anti-sucretif guns in each ship cept. San I rancisco and Battim rewhich had four senth guns. Guns were in great demand elsewhere while our ships were fitting out and for stru tural reasons also it was necessary to limit their arms ment to anti-submarin defense. It was contemplated that the squadron would always be escorted by distroyers and be

always be oscured 14 x d stroyers and be supported agounts art is error be. With names filling so much of the living dick space the cross were very crowded most of the time. Mines were constantly at one s (bow horis and slaip cerous over roady t) (ear me s clothes and every where were mine tracks half kine high or turntables () trip the aniwary. But no complaints good humer always. On

ship's joke demands a would chevron for every calloused shin. The efficers and men felt intense overy callound shin the enters and men net meets pride and interest in their ships and spared no effort to keep them in regular man-of war condition. The 10 American ships made a handsome squadron and the British officers as well as our own openly expressed their admiration

In capacity for carrying innes equipment for handling and planting them continuously and general arrangement and quality the America munclayers were admittedly (70 ) ntinued)

#### Fluorescent Fluids

PROI JEAN PIERIN Head of the Department of Chimstery in the University of Paris lias just published the prelumnary data and conclusions in coin action with investigations which is lias been making of the phenomenon of the finorscence of fluids the phenomenon of the finorscence of fluids these investigations were begun some time ago but interrupted by the war and it is not only now that Professor Perrin has felt his thosis to be in such shape as to render publication possible. The investigator has started with the idea that

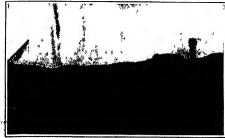

into investigator has started with the idea that fluorescence is in soin way a phenomenon of the molecule and with this idea is his prepared glass slides with the object of spreading out his fluorescent solutions to ultramicroscopic thickness. The immediate results of this procedure are to make it clear that fluor escence involves the destruction of the fluorescent hody—not a reversible reaction which would make it possible for the fluorescent substance to regain its luminous powers after a period of rest but something in the nature of polymerization to mention one possible vilanation advanced by Professor Perrin Indeed he feels impelled to suggest that parliags the molecule is fluorescent only at the very instant of its destruction so that in the most literal sense we have a phenom cnon of physical disruption

An interesting point brought out by Professor Perrin is that temperature and viscosity appear to ever in influence upon filtorescent powers. He even went so far as to compare results obtained at ordinary tem-perature and at that of liquid air with negative results far as appreciable difference was concerned

There is a good deal of analogy between the results Incre is a good oeal of analogy between the results obtained by the investigator and the known facts of fluorescence of solid bolies although Professor Perrin is carried to keep the two cases distinct. On the whole the discussion as translated in this work's SCLENTIFIC SUIPLEMENT, is a most interest ing one

Trainlead of mines on way to the quay

## The Service of the Chemist

#### (olloids at Work

CRAHAM discovery that if par hinear or parch among party is stretched over a frame to make a hypthage that such a lapsthage that such a lapsthage or membrane will exparate substances into two general closes. Those which can pass through a self-time and the se which can not or only do so with gen third out. It is satisfances which can pass are only capable of longer yestellanded while can pass are only capable of longer yestellanded while can pass are us tally capable of being systalized while the thers are 1 lly like and their solutions have proper to a which differ markedly from solutions of well known erestals. A favorite experiment is to place a solution of salt and of gluen a nembrane on the other side of which wat r flows slowly like salt passes through into the wat r and son the glue only is to be found in the membrane covered cell

This principle has been applied commercially in several industries and is variously styled dialysis diffusion, semesis et. Some exvisaline substances diffuse more rapidly than others so that certain separations can be made between crystalizeds as they were originally called 5 metures the vegetable cell itself becomes the membrane through which sugar for example is extracted by treating the sheed beet in this instance with successive changes of water. The temperature is made such that the abinimus are first congulated in the cell walls thus facilitating the passage of the sugar solution and then cight or more changes of water are brought into contact with the pencil size V-shaped slices upon the counter current principle. This allows frish water to take the last of the sugar (all but about 0.5 per cent for it is not economical to carry the extraction below that figure) from the nearly exhausted pulp and the juice of highest sugar content to be drawn from the first cell for purifica-

In the beet sugar industry we also find an example of osmosis using a membrane. A point is reached in crystallising out the sugar when even impure crystals cannot be wen from the residual molasses. This molasses contains above 50 pr cent of sucrose and is unlike molasses from cane in bring unsuit d for human use The sugar is recovered by precipitation with strontium or lime or by issues. In the latter method the diluted molasses passes slowly along one side of a series of membranes and water flows in the opposite direction on the inther side. A large percentage of the sugar passes through

sugar passes through Within comparatively risent years colloids have been studied more intently and minh work has been done in a effort to learn more of what socially takes place in reactions involving them. Their aqueous solutions when pure have the same bouling and freezing points as the solvents the maclives so the conclusion is that they are not true solutions but its search of the particle in suspension. These particles passe through the finest hilter paper sand evint are most maintained to the condent has particles passed in the particle passed in a small to be seen under the microscope The ultra microscope enables some studies to be carried on through the observation of the shadows cast by the particles and light reflected by them. Col-loidal gold is responsible for the beautiful ruby glass and colonial copper was used for red signal glass until chemistry pointed the way for the employment of selenum to produce that color

There are many who grow important awarting some practical results from a addenic toward which seems at times to move with the speed of a gleener and yet progress is not made without such research. How often progress is not made without and restaired. In we offer our ative medicine has been compiled to wait intil a way of communicating the discussed inder investigation to lower animals for study could be devised. We know now how to propair colloidal suspensions and that will head to many commercial applications. At least two
may be mentioned as accomplished and one of these has been developed as a result of the war

The importance of a concentrated easily handled efficient fuel for war and merchant vessels is obvious and in times of emergency when speed and space count for most this importance is greater than over A colloidal chemist conceived the idea of fortifying fuel oil with colloidal coal so fine and in such a physical condition that it would be permanently in suspension go where the oil would and pass through the small orifices of valves and burners without clogging them Experiments showed the idea to be sound and its further development will be an efficiency and conservation measure

The extensive use of metal automobile bodies in troduced a problem in lacquering and enameling for, in order to get the required hardness and durability in the finish, it must be baked Eventually electric ovens of

great size were installed and all went well until, in an effort to economies in the use of currant the ventilators would be closed or partly closed with the result that highly inflammable vapors from the leaquer and cannot evolutile solvantic solvantic solvantic solvanties of the covers. There were fires and wild explosions, loss of work and disturbed ackelulus.

has condition affected the oven manufacturers more than the cannel makers and one of those making electric heating and controlling devices for ovens in-stituted research not on the apparatus but upon an and the control of the apparatus but upon an account must be expensive and troublesome volatile solvents. The problem has been solved and the anne covering materials—gums, pign not set may now be had in colloidad forts in water. They cover well, bake without any material variation from the usual bake without any material variation from the usual mit thods of treatment and whin mit on the metal the result is the same. The event into be operated to suit for there is no danger. The element of safety and freedom from property loss have been secured without increased cost, if indeed not without an actual saving in

creased test, if indeed not without an actual saving in the expense of enamals. And then because the gume art in suspension and not in solution there is nothing to it is clearly interest stick together. They may be put into a wire basket, dipped into the collocal lasquer and haird without being removed and given the individual attention necessary with other leaguers. If the mid can be backed sightly before dipping a still better job to he obtained. There we not fits decrease and no works of without careful and the second of the contraction are no fat edges and no marks of adhering to other pieces. Such lacquers or enamels may also be brushed on or sprayed as desired.

These developments are real steps forward and further achievements along these lines may it expected. Col-loidal chemistry and physical chemistry theoretical index (nemistry and paysical definistry theoretical though they may seem, are accord, lishing great things for industry and when we begin it graduate chemical enginers well grounded in these new divisions of chemis-try, still greater things may be expected.

#### The Reporters' Chemistry

The Reparters' Chemistry

A GROUP of schusters who are discussing the
A courses which a obsenced inputer about take in
order to be all that the tith might be said to imply
finally included nearly all the inputering and applied
science available in addition to a few years spent in
obtaining a broad foundation in guaral subjects. They
left but a few years for practice after greduction in the

# industrial Democracy and Engineering

Some Lessons That Have Come Out of the War

By Irving A. Berndt, Secretary of the Society of Industrial Engineers

CIVILIZATION, ever progressive, is completing its latest great step forward and after monumental effort, almost inhuman sacribos and a stupendous massing of resources, we are promised a great world

democray

Even before the culmination of this advance, and
seemingly as an outgrowth of the very program and conditions which have made this step possible, this same
insatiable eviliation is making a new demand for advancement. It is from all indications now insisting that

wanesent it is from all indications now measuring that we must have not only a great political world democracy but a great industrial democracy as well. The great war was proven that not only must the old political regime be changed and readjusted but a re-consideration of the industrial and economic plan must consideration of the industrial and economic plan must follow and if possible go hand in hand. The great world leaders and the best minds are coming to a thorough appreciation of the fact that workers and producers of the divilized population of the globe besides being goverand politically along the broadest kind of demo-cratic lines, must also be allowed to produce under a smilar plan and set of principles. Does this not spell an industrial democracy in every sense of the word?

Here it might be interesting to consider for a minute what steps have led up to this new development. It what steps have led up to this new development. It has been especially interesting to study it in America and to see, sometimes gradually sometimes slowly and some-times over night, the marked changes which have come over our industrial verspoints and attitudes Ex-periences has been doing it bit for us in this country during the war. Many things has it laught and espe-cially as regarded the industrial activity necessary for the votory we won, has it given us lesson after lesson Then, too, these lessons have been generously appor-tenced, not only to the government administration and management but to each individual worker as well

us consider some of the very well known features which, coming out of our war production requirements are here to stay Broadly these can be classified under

two headings. First, those dealing with the principles and plan of organisation and management control and second those which have to do with the personnel and individual worker under the firm. In the first classification these propularly accepted are probably as follows:

(a) A plan for proper fun tromainstation of response

- (b) A plan for centralizati n of control and manage-
- ent of each function
- ment of each tunction

  (c) The application of expert knowledge to each of the arious problem
- (d) The use of the trained a and the development of a plan of more intensive training for this pur
- (e) A plan under which lefinite programs of all
- activities are preplanned

  (f) A most intensive plan if specialization

  (g) A plan for producing absolutely on a basis of

quantity production

Under the second class the laving to do with the reconnel or individual, we find a new acceptance of the

(a) The proper solection of men for each job

(b) A carefully worked out than of proper distribution

and assignment
(c) A well defined and star tirtized incthed of in

tensive training

(d) An adopted provision fractificatory conditions of work and activity work and activity it seems hardly necessary (1) is lin k and justify the acceptance of each one of the first rice. Suffice it to acy that they have all been used as of found not only valuable but really essential and for each there are specific applications available in further analysis and specific applications available in further analysis and provided the second of the specific applications of the Sheet vs. Service Dead without the proven access of the Sheet vs. Service Dead without which our armies would privable still be in bloody

combat is an example of not only all the features stem

And from all this has come two big realisations so big in fact and so fundamental is to make them we believe a possible keystane for the Industrial Denoise believe a possible keystane for the Industrial Denoise racy for which there seems to be such persistent and continuous demand. Both are so equally important that it is extremely difficult to know which to set forth first. They should not be considered a sparsately or in any order but rather in conjunction.

The one is the realisation by the mass including all of us as workers producers or traders of the need for proper leadership and control and a leadership based not on wealth social distinction or political power but one coming from proven ability and experience as well set the necessary training and education. The other is the realisation by these accepted leaders and directors that at the very base of every problem of management and control is the human factor and hence there must be as a part of this leadership a since re appreciation on their part of the problems and viewpoints of our workers and a real desire not only to study their requirements but in complete cooperation to fulfill them

The writer ameerely believes these two visions have come and despite the scattered outbreaks of strikes and industrial unrest is entirely optimistic of the outcome because of a complete confidence in the higher intelligence because of a complete confidence in the influence account of average American people who with such visions will live up to them. Nor have those now convictions come alone to those in this country. On the battlefields of trance we believe all of our soldiers have had a similar experience and when they all return we shall find that the men in the ranks have learned to respect able leader-ship and that our American Army officers will have learned to respect and appreciate human relationships.

These men will be a big factor in our industrial readjustments

Returning to the question of definite industrial (Continued on page 254) A Phonetic Alphabet

#### Washington D ( That Molasses Explosion

ven to forty-five

To the Editor of the SCIENTIFIC AMERICAN
I have just been reading in your issue of February 1st, I have just oven reading in Your saute of rebruary lat, some comments of yours on the recent explosion of a tank of molesses in Boston. That the explosive potentialities of molesses were reorganized a long long time ago is quite evident from the language of an old song of which I send you one viree and the chorus.

Old Dan Tucker come to town He swallered a hogshead o lasses down The lasses worked and the hogshead bust And off went Tucker in a thunder gust Свович

Out o the way old Dan Lucker Out o the way old Dan Tucker Out o the way old Dan Lucker You re too late to come to supper

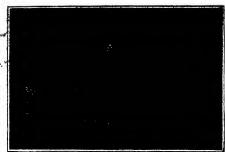

As a poem no doubt the foregoing leaves much to be The language is inclegant and the last line of the chorus is certainly a lame and impotent climax following the tragedy of the previous stansa. Nevertheless compared with rea libre it is a literary masterpiece I have known this song since about 1855 and quite possibly it dates from 1775—I do not know The verb to work used to be commonly employed by country people to describe fermentation Cider, preserves and molasses with some other substances "worked under rtain conditions

# Ticks as Carriers of Animal Disease

Inferences Drawn from the Destruction of 500 Reptiles at the New York Zoological Garden During Several Years By W. H. Ballou, Sc.D.

DAH's newspapers recently reported that some kind of an epidemic existed among the reptiles at New York Zoological Park Losses of over fifty anakes daily were ascribed to cootics a name given by the British Tommics to the french louse

Dr Raymond I Difmars Curstor there of reptiles and author of Reptiles of the World admitting to the and additior of reptities of the world amulting to de-writer that an epidome, had been raging defined that it had been caused by cootes. Incidentally he stated that the carrier of the disease was a tick and that a check on its ravages had been secured by use of a libral coating of arsenical insect powder on the scales of the snakes, lisards, etc. Over 500 snakes succumbed during the past several years before the check was dis-

By this it should be understood that Dr. Ditmars has

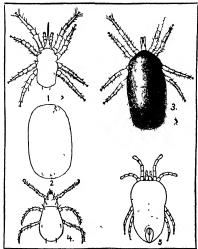

only succeeded in getting rid of the ticks in the Reptile House, thereby preserving the remaining reptiles A new consignment of reptiles inay at any time reintroduce the epidemic The droad disease of Piroplasinosis which annually wipes out inilions of deliars worth of cattle, fowls and domestic animals generally in different parts of this country and the world is according parts of this country and the world is according to bacteriologists the disease which is destroying the snakes. The value of a serum is indicated by Muir and Ritchic in the new revised edition of their Manual of Bacteri

clogy when they say disease) of infection by Piroplasmata, we know nothing The diseases are often extremely fatal carrying off meanly every individual attacked but we do not know the nature of the changes originate i

Suppose a half dozen Zulus from South down in a crox led New York theatre. Close contact would sur by result in these Zulus giving off the diseases to which they are in mune at home and infecting some or all of the crowd of strangers to which they were intro-duced. The Zulus in turn night be infected by the germs carried by New Yorkers to which the New Yorkers were minure. Neither of the parties to this meeting would have natural decresses against the diseases of the other Presselv that is what happened at the Brons Garden Some Iguanas (lizards) were re-ceived from South America. They bose upon ceived from South America. Buy hou inpon that bodies titles from it is parisated ideas et on which they were timining. The prizated carried by those titles laid never be in able to break down the defenses of the iguanas although constantly irritating them. On arrival at the Bronx Garden, filled with keel scaled vankee the takes acampered off the backs of the iguanas and stracked the defenseless snakes Im-mediately there when a preferent first among a large group of Australian anakes Having killed off the entire collection from Australia.

the ticks attacked all other anakis finding easy victims among those with keel, rather than smooth scaled snakes. The snakes which alone escaped attack were those from South America where the iguanus came from showing that they too, in their own environment, had acquired immunity

The keel scale may be described as rough with a ridge across it, as against a large scale which is smooth. The leel scale affords an opening into which the female tick can thrust down its head and lay its eggs in the blood can thrust down us ness and lay its eggs in am one-liere the young ticks hatch and live a subcutaneous life A parasite is released from the blood in the tick egg into the blood of the snake, where it breeds with continuous rapidity I he parasites accumulate in the lessons of the snake, a septic condition follows and death is esuised by intoxication (blood poisoning) Cobras from India are not affected The American gopher snakes are affected only

The ticks that carry pirapianmosis. (1) The female, (2) the egg; (3) the tick after feeding on animal blood; (4), (5) the chigger or tick that attacks humans

around the eyes, which swelled up in some, caising total bludness. The Australian keel-scaled anakes were rapidly swept out of existence—a clean sweep-from blood poisoning. Many other keel-scaled anakes succumbed. Dr. Ditmars observed that anakes in damp cages succumbed most readily. He put them in dust cases with feet ratification and the misses according to camp cages succumbed most readily He put them in dust cages with fair results and thereupon evolved the eure. By dusting the anakes with an insect powder, containing a small percentage of arsente, the openings of the scales were closed and the ticks killed. Ticks also the soles were closed and the ticks killed. Ticks also caused skin theses, that is, cruptions, or tileers of the skin which the use of the powder ended. The powder, penetrating the pores in the skin, naturally risched down, in some cases to the oggs of the ticks, killing them A sick snake, reached in time, thus had his enemies killed, his ulters and infection of blood given a chance to be met by the reptile's natural defenses. A cure followed,

if the snake was not too far gone before applica-

if the snake was not too far gone before applien-tion of the powder.

A snake, of course, is an extremely nervous animal and griting him thoroughly powdered is some job. Handlers of snakes have to be careful with affected snakes, as he toke readily and willingly transfer their operations to humans whose blood they somehow know is far cases to reach. Many types of snakes carry mai-arral germs but are immune from malaria. When, however, they come in contact with snakes without such immunity, the disease takes snakes without such immunity, the disease takes hold of the non-immunes. The igunas and the snakes from the same region of South America are immune from the blood contamination and ulcers caused by parasites born by ticks. These same iguanas and snakes, however, when introduced to reptiles having malaria or other diseases, get those diseases, having no immunity discass, get those diseases, having no immunity thereform. Thus is shown plainly how disease may apread among humans and lower animals It also indicates that we get diseases from which we are not immune by contact with persons or lower animals which have the germs persons or lower summans watern involving grains but are immune from them. We leave New York and travel. We get disease in a new locality from persons who are immune. The strangers we meet get disease by contact with avangues we meet get usease by contact with us by acquiring our germs from which we, sur-selves, are immune. These matters which have been proved by the universal war on disease ought to impress our health authorities with the fact that mere quarantines are not enough to wholly stop the introduction of disease as has been shown by the world-wide spread of influensa. Let the people or animals out of quarantine and they immediately give off the garms from which they are immune to people who are not immune, and vice versa. Our previous knowledge of tests as carriers of

blood poisening parasites has been summed to date in their new edition of the Manual Bacteriology, by the distinguished scientis

Decime Robert Muir, Pathologist of the University of Glasgow, and James Ritchie of the Royal College of Physicians' Laboratory, Edinburgh Of Piroplasmous they say.
"Up to the present, no human disease

"Up to the present, no numan diseases has been proved to be associated with the presence of piroplasmata, but several important diseases causing world-wide devastation of domestic animals are almost

# Railway Terminal Problem at the Port of New York

Plan for Bringing Manhattan Island Into Close Connection with the Railroad System of the United States

THI New York and New Jersey Port and Harbor Development Commission recently invited Gustav Lindenthal who designed the Hell Cate arch bridge Indentinal who designed the 11cm case aren brings to give his views as to the bost method if solving the transportiti ii problem at New York particularly with regard to the Hudson River and the transfer of freight and passe ingers between N w Jersy and Manhattan

#### Earlier Attempt to Solve Problem

We recently drew attention to the fa t that over a quarter of a (cutury ago the urgent need for lietter communi at m between Manhattan Island an I the main land was fully recognized. The great railway systems that terminate on the Jersey water front were particularly concerned with this pr 11 m and an attempt was made under the initiative of the Lemsylvania Railroad to get combined action of all of the initroids for the creation of a great bridge across the Hudson River for the accumumodation mainly of the steam railroads but also of trelley tracks and vehicular traffi Partly because of he inclination of the rule pads of that day to throw the greater part of the hurden of construction upon the Lennsylvania Railroad and partly because the development of the electric locoin tive removed the principal objection against tunnel triffic the bridge project was abandoned and the Pennsylvania Railroad built its own tunnels at 33d Street

#### The Present Enlarged Sch

The plan which Mr Indenthal presented to the Commission is shown in the birds-tye view of Manhattan and Jersey ( ity which will be found on the front page of this ossue

So far as the railroads are concerned it will be a that every one of the systems which now terminate in Jersey (ity will have direct entrance into Manahattan for freight and pass ngers and also unbroken communication with the railroad systems on Staten Island, on system is so arranged moreover that all railroads which enter what it is hoped will be the free port of New York will have direct access to tidewater throughout all

Nork will have direct access to indewater throughout all the stretch of shere from tage, both on the Hudson and base flivers and on the Upper and Lower Bays. The total estimate i cost of the project is \$211,000,000—a large sum considered by itself it is true but not so large in comparison with the total cost of approximately \$500 000 000 of the subways used merely for local passenger transportation in Manhattan and Brooklyn

#### What It is Proposed To Do

The main elements of this comprehensive scheme are

1 A belt line situated about two miles from the Jersey water front and intersecting all the railroads that run to tidewater

- 2 A large freight classification yard for breaking up and reassembling freight trains for dispatch to the several destinations of the freight
- 3 A railroad and vehicular bridge across the Hudson River opposite 59th Street Manhattan by which freight and passengers from the West could be carried directly into Manhattan
- 4 A large central passenger station 800 feet long by 480 feet wide to be built in Manhattan
- 5 A two deck elevated railroad with four tracks on each deck kading from the bridge and extending along the Hudson River water front of Manhattan Island from the bridge to the Battery, and a tunnel at the Battery

connecting the southern end of this elevated railway with the railway system in Je

6 In later years, when the system outlined above is on it is not years, wear too system outsine above a completed it may be strended by carrying the marginal elevated railroad around the Battery and up the casterly short line of Manhattan on the hast liver, and also by building a tunnel from Greenville N J across to Brooklyn to connect with the existing railroad system on Long Island

#### Hudson River Bridge, the Key to the Situa

It will be realised at once that the most important link in this whole project will be the huge bridge across
the Hudson River at 54th Strict Because foundations
in the middle of the river would have to go down from in the middle of the river would have to go down from 250 to 30 feet to find rook bottom for a pior in midriver it is absolutely necessary to span the entire width of the Hudone without any intervening pier. This means that between towarts the bridge must measure 3000 feet which is about doubt the span of the cutting Brooklyn suspension bridges. Good rook foundation can be found on each shore of the rive upon which the mann be found on each shore of the rive upon a which the mann of the state of the finings tower in New York, which is served. The bridge waited he earned on four calls in each of which, if bridge would be carried on four cai les each of which, if bridge would be carried on lour call see can on write, it built of wire would be five feet in di meter, as compared with the 15-inch diameter of the cables of the old Brooklyn Bridge. To get the necessary gurder width to result the enormous wind streams, the bridge would have to be about 175 feet in total width and thus on a two-deak structure would provide on the lower deck room for four reaght and four passenger-train tracks and on the upper deek for six rapid-trainit tracks two wide drivoways, and a passenger promenade By far the greatest load that the bridge would carry would be the deadload of its own weight. All the heaviest trains says Mr Lindenthal, and all the vehicular loads that could be put on the bridge would be only as a string of flies on a heavy wash-line

## Continuous Boulevard, Long Island via Manhatt to Jersey

One notable advantage of the bridge which will commend itself very widely, is that it would do away with the present irritating congestion and delay which trucks and automobiles have to endure in getting across the Hudson River a The slowing up and whicks for the purpose of paying toll could be avoided by making highway traffic over the bridge absolutely free from tells. It is estimated that the automobile traffic alone over the bridge would exceed 6,000 000 oars per year lis capacity for motor truck transport would be very great this is estimated at 100 000 tons of freight every 24 hours

#### Classifying and Distributing Freight

The idea of a classification yard on the New Jersey side is an old one and its advantages are evident. Under this method the different radioads would send their frisiph into one yard, where the cars going to the same destination would be conshipted into separate trains and destination would be combined into separate trans and sent to their local stations. Conversely, returning empires would be made up into trains for dispatch to the property of the sent of the sent of the sent of the the Manhattan aids of the Stifter they would pass down the clevated railroad on West Street and, ultimastly, when the system is extansible, would continue up the East River front. The sewerage haul to and from this clavated structure for stone disturys would be from onehalf to three-quarters of a mile

It is evident that the Hudson River bridge at 59th Street, and the tunnels from the Battery to Jarsey City for emply returning cars, would offer a circular system of transportation of great capacity and elasticity for the handling of every kind of freight. The marginal elevated railroads, moreover, would be associated with a system of warshouses manufacturing lofts, market halls and freight stations, which would be located alongaids the elevated structure. The freight could be delawared by gravity to attent level and there picked up by motor trucks for distribution. Although the bridge would cost about \$75,000,000, so

great would be railway track capacity that it would take 18 tunnels to provide the same amount of accommodation It is perpetually reiterated that a tunnel is much cheaper than a bridge. As a matter of fact, compared on the basis of capacity, it is very much dearer

#### Question of Financing

Speaking on the question of financing, Mr. Lindenthal told the Commissioners that as the result of a thorough investigation of this question for many years, he believed the interests of the public would be best served by a separate terminal organisation acting as an agent and trustee of the Federal Covernment, and that such an organisation with large capital is in process of formation Because of the multifarious advantages conferred, not Because of the multifarious advantages conferred, not merely to passenger and freight traffic but to the automobilists and to real estate and other interests, particularly in New Jursey he is satisfied that no public funds would be required and that private capital will willingly come forward to build, equip, and operate the entire improvement, when once it is sure of the joint cooperation of the railroads, the Cily of New York, the communities on the New Jersey side, and of the United States Glovernoon.

#### Lead Poisoning from Nursing Bottles

Lead Poisonning from Nursing Bottles
FOR several years muring bottles for indate have
been made of a kind of glass known as crystal metaed
ordnary glass, because the former is much tougher
and, therefore, less liable to break during the process of
strellastion. A few weeks are a Franch physician,
Dr Guerbet, made the startling statement that he had
found that a case of chrome possoning is an minart three
months old was due to the lead derived from the glass
in which the minart's mulk was strellased. Ordnary glass
does not contain lead whereas "crystal" glass constains a
town of the startling of the strellage of
contains and the startling of the strellage of
contains and the startling of the strellage of
contains and the startling of the strellage
I see well known fact that when salt water is estellaged
in crystal feaths lead childred is formed, even if the content of each is only nine parts in a thousand. Dr Guerbet
to deal to only nine parts in a thousand. Dr Guerbet
believes that a milds notion cours through a slight
aliaintry of the salt on the shlorides it contains

alkalatity of the milk or the shlorides it contains. While the amount of lead thus denotived of the milk would, of course, he very small, it might easily become injurieus in the course of time since lead is what is income as a cencu-lative spiceo, it is, instead of being immediately ellim-nated it socurables in the tissues until a sufficient quantity is present to soft as a servous poison. Dr. Courtest gives no far as to demand the peames of a layer forthidting exystel giant to be used in the canantisation of making the contract of the place wave conjupted for continuous

#### The Part "Engles

AS part of our naval polity against the U-boat is was A decided to build 100 steal reasels of about 500 tons displacement and 18 knots speed and displate them to European waters They were of a mongred design, unlike sarything existing here or abroad, indeed, in naval eyes they were saither "fish, fiesh fowl nor good red hering." To small for service on the high seas, too slow for effective sub-

herring? Too small for service on the high seas, too slow for effective submarine hunting, wedge-bowed and slab-sided, they are an object-lesson in the folly of political and layly technical matter as that of determining what kind of vessels should be built for naval purposes

For it is no secret that these boats were built against the advice of those naval officers whose duty it is to determine what are the needs of the Navy and what kind of vessels will be see including the secret of the Navy and what kind of vessels will be see inceed of the Navy and what kind of vessels will be see including the proposable for these nonde script craft, nobody seems to know, but the recent hearings before the House Naval Affairs Committee developed.

the following facts

1 That a total order for 110 of these boats was given
to Mr Henry Ford, or, to be more exact, to the Ford
Motor Company

2 They were to be paid for out of a \$100,000,000 Emergency Fund, known as the Presidential Emergency Fund 3 That the contract price was \$275,000 per boat, and

3 That the contract price was \$275,000 per boat, and that there was to be a fixed profit of \$20,000 on each 4 That (according to the testimony of Chief Constructor Admiral Taylor) they have cost at least \$400,000 per boat, and that the armament will add \$110,000 to that sum

that sum
5 That Ford put up a shop 350 feet wide by 1,400 feet
long in which to build the boate by 'Ford methods,
and that the Government furnished \$3,500,000 to finance
the job.

the job

8 That when the armistice was signed, only seven
boats had been completed, that five of these had started
down to the Atlantic, and that they only got as far as
Queboe, where they were frosen in for the winter
We understand that the contracts for 50 of the 110 have

We understand that the contracts for 50 of the 110 have been cancelled and that the other 60 are to be completed Good looks we are bold were sacrificed to speed of construction. The above facts show that we did not get the speed, and a glance at the photographs shows that we certainly did not get a natural beauty. The man armament consists of two four-inch guns, one mounted forward of the bridge, the other on a deck house

aft. There is an anti-aircraft gun on the quarter deck. The picture shows that the Lagles can do some lively rolling, even when the sea is in a peaceful mood, what their auties would be in a fresh breese and a lively sea can be left to the imagination

And what a gun platform!

#### The Battle-Cruiser "Repulse"

OF the new shape, built for the British navy during the war, none have created greater interest than the Repulse and Renown. When the war started they were included in the 1914 program of new construction. These two and another shap were included to furm part of the Royal Sovereign class shape of 25 750 tons dis-

One of Ford's "Eagles on her trial trip

placement and 21 knots speed. On the outbreak of war at the matance of Lord Faher a string advocate of the battle-cruiser, the plans of two if the ships were redrawn on battle-cruiser lines.

on battle-crusser lines
Persistent reports of a semi-official character led to
the belief that these ships wer consolrably over Section
and 38 knots contract speed. If the London Pagemer is
correct that is an over-stat most and the leight is
slightly under 500 feet and the intra taged dwas about
31½ knots—the highest speed on trivial ring 13 knots
The armor is light and disposed on a nivel plan pretection against anxions by guinter, and torprobe bring

# World Markets for American Manufactures

Edited by LYNN W MELKINS

A department devoted to the extension of American trade in foreign lands

#### Expert Exporting

Some Suggestions for the Middleman in Foreign Trade By an Exporter of Forty Years

THE house that I uve all over it United States and specific and I will be shall all over I stin America is a middle man—an export middle man. N with middle man is the fellow whom nebody loves the manufacturer is always frying to channed him and the foreign bayer would be glad to avoid paying, the commission on which he exists so the right of the middle man terry in his business is all comprised in the or will serve.

One kind of serve class tid with packing and marking.

A g y all rad has been said on the subject of packing

against the rig rs of seath American stevedoring but there is one aspect of the subject that has been little touched upon I very exporter should remember every laws ar always on the job and that they are administered without four or favor

In particular he should remember that duties are usually in the gross weight but that the rates are arrived at by reasoning what would be a fair impost on net weight. Accordingly the importer annut afford to have his packages made at y more secure then necessity demands in filling a large order for lades stockings the erments came from the inct as in cardboard haves that weighted as much is the stockings themselves and in these because they were again packed in wonden enses that weighed 100 pounds. The duty would have been tremendous to say nothing if freight at 50 cents per cubic foot. We eliminated the cardboard boxes cubic foot. We climinated the cardboard boxes and the packing cases and the the stockings up in bales, hydraulically pressed. In this way we saved the Salvadorean customer 75 per cent on his fright bill and an incredible sum in duties giving him real a rvice that he could afford to pay for

In another case where the outcome was less happy the victim was hunself to blame. In happy the victim was binned for blame. In this country on a visit he bought is handsonic safe for his home office weight our ton or threabouts. Being of an economical turn of mind he perchased a fine line of silks handser-tches shaved etc. and pricked them in the safe to save shipping and pasting; harges. But the made out his consider movie in such a way that he left the home ustoms officials no

that he felt the home ustoms officials no alternative other than to nitespie it he safe as the container for the silks so his duty bill read, gross weight 1 1000 kilos at \$4 gold by r kilo \$4 000 gold! He kirked but to no avail he refused to pay and his safe and his silks were said at public auction pay and his sate and his wise were said at phone aircrain. Had a similar error been made by the American exparter, the house would of course have had to stand the loss

the noise would of ourse nav. and to stand the loss As important as the picking is the marking Of course the middlemin should always pack his goods under his own brands selecting a short name with a picture so that the illiterate native can demand the goods by asking for the bar or the herse or the palm goods by asking for the bear or the herse or the palm in a few years such a brand will have acquired a very real money value but the marks must be used with the greatest of judgment especially when it comes to a question of pames. Now it is a delicate touch to brand question of names. Now it is a delicate touch to brand the purchasers in one on his goods—provided he wants it there. But if he himself is a middleman he doesn't want it there because his customers don't want it there he would have as much difficulty disposing of goods bearing his own name as he would of goods marked with

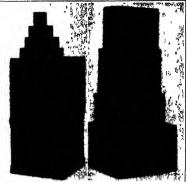

vours Norstailer is going to let the wholesale radyertise himself at his expense if he can help it I well 1 well remember a ship sugar-pine boards made to Buenos Aires with our name stencilled name name in big letters as The consignee

men to scrape our name off the boards, charging the expense to us. It amounted to \$150, and we had to pay it We had been too anxious to serve ourselves, mate and of our customers.

If marks are to be used sparingly when they betray the source of the goods, we cannot make the destination or the route too plain. If the goods are in straight wooden cases they should be marked as follows

> 8 del C BOGOTA GIRADOT BARRANQUILIA NEW ORLEANS

The initials must be four inches high and the towns two inches. This shipment speaks for itself, it shows that it goes to New Orleans, theree to Barranquilla by

Tallow and tea for transfer across the Andes In each instance the indi-vidual containers are shown on top of the pile of cases

ses, to Giradot by river steamer to Bogota via rail and mult. If the goods are in below with iron hoops, do not try to stend the shipping marks on the burlap surface they will not show up. Get a printer to print them on prece of cotton cloth, and fastir these under the steal The loss avoided on one slupment gone astray will pay for years of such marking moreover goods thus will pay for years of suon marking moreover goods thus marked when identified to port officials by pilotographs accompanying the documents indutually get to their destination weeks or even months ahead of those that are left to take their chances in the regular course of

Another important consideration in packing is the size of puckages Labor in Latin America is all by hand, and the native workers have little muscle and less energy that should The heaviest case of 120 pounds be nicely handled gross This can

by one man or by two, and two of these cares make a good nule load. But if the goods are to go where trans-portation as va liams they should weigh but 50 pounds per piece, since the limit for this animal is 100 pounds, properly balanced

Nor is also the only feature of a package, it may be susceptible of improvement in many other respects Dried shrimp had for years come from Mexico, for re-export, in second-hand sacks of any old size and weight But when we got a big order for these shrimp from the mines in Chile, the price and the freight were such as to make it certain that the buyer would expect to receive every pound he paid for So we repacked the shrimp in neat wooden cases, with a brand, and now we get all the orders We repeated this performance, with similar results, in the case of tallow, which had always gone out results, in the case of tailow, which had always gone out in old oil-tins that were in poor condition when they started the trip, and which we shipped in heavy tins, specially made, and each incased in a wooden framework

When you have got the goods all packed and When you have got the goods all packed and ready for shipment, you have got to supply your customer with invoire, bill of lading, and insurance policy. Dont is too there, try to think of something else that be could use and that you could give him. One such thing is photographs. You can, for a couple of dollars, supply him with a couple of dole me pretures of his shipment, pictures that will show the handlers of the goods en route what they are, pictures that will show the buyer how the goods are coming to him, pictures that will show his customers what the goods are and how they are coming to them After doing this awhile, you will be surprised to discover what a big selling the surprised to discover when a sell your customer and they sell him indirectly by selling his customers. When a man is forced to buy goods without ever having seen them, the goods without ever thaving seen them, the possession of photographs telling him how they are to be packed right down to the outside case, as a fremendous comfort to him

Similar in contact but somewhat different in puipes in the provision of documents that will show beyond question that your goods left the pier in proper order. A well regulated sugar refiner is always glad to have an outside chemist inake an analysis, as it gives him a check on his own factory, but a sawmill turning out box shooks by the carload is not always so careful as to measurement or count when they know that the middleman who pays the bill will the goods The \$10 per car for a Chamber of

Commerce expert tally is here money well spent Such goods may not reach the constimer until they get to Lima or La Paz thousands of miles away and th to Lims or La Paz thousands of mies away and unou-sands of feet up. Then they may not be just what was experted, and what are you going to do about it when the consignee refuses to pay? You can it do anything— unless you have your Chamber of Commerce certificate, unless you have your Chamber of Commerce certificate, with a clause in your contract providing that this certificate is final evidence of quality and weight of the shipment I have seas thousands of dollars saved in claims by proper attention to these certificates, and as many brousands lost by failure to have them They are not to be thought of as a means for beating your customers to be thought of as a means for obscuring them. They make it possible to any just where the trouble flee, and in particular they make a proper than the property of the proper ticular they make it certain that you will get back at your wholosalers before the evidence of their faults has passed

# Future of British Flying

#### What the British Government Is Doing in Preparation of the Coming Civilian Aviation By C. H. Claudy, Special Correspondent of the SCIENTIFIC AMERICAN Now in London

EVERY one realises that the war has forced a hot house development of sylatron, which has accomplished the technical and constructional advances of 20 years, in the past two What apparently is not comminment the technical and constructional advances of 20 years, in the past two What apparently is not generally recognized, is that the greatest advances have been made, not in France, not in Italy, in spite of the Caproni and its wonders, not in the United States, for all know no other country could put a satisfactory high-horse-power, low-weight engine in production, but in

The development of the flying machine, the flying machine pilot and the flying machine factory in Great Britain is something which

positively staggers imagination I hope to tell at least the main outlines of that enormous accomplishment later, if for the time being it can be assumed that the size of the industry is enormous and that only the armistice prevented its flowering to proportions at least double the capacity the United States talked about and did not achieve-20,000 engined planes a year-a common ground can be reached whereby we may consider that the future of British aviation is not unhkely to be the future of the world's aviation Certain it is however doubtful that may be to some Americomanuace, that the States must look to its air industry, its air laws, its civil aerial transport look quickly or Great Britain will have forgod as far ahead of us in this utilisation of this greatest of gifts of war to peace, as she has in her war sviation program It is too early as vet to

spoak with any certainty as general and the United Ling-dom in particular is going to go ahead with the civil sorial transport idea. It is pointed out on every side pointed out on every side where that question of "what" and "how is asked, that "we are still at war and no one knows until oe is actually signed, just what sort of an army or naval flying establishment we shall have to maintain It is also pointed out, although this seems less obvious to the man in the street, that no resumption of the hit or miss civil flying of the old days is possible with the new far, fast and highflying planes in abundant supply, that new laws must preceds civilian flying and that an international agreeon international laws should precede local laws, and that no international

convention on air laws is likely to be formed until the peace conference has finished its work

finals die work
But if the particular "why" and "how" and "what"
of future Bettish civilian flying is as yet indeterminate,
there in achting wages or closuce about the preparations
made agetiset the time when passes and laws duly made
and passed make possible the beginning of the great
development of cavil serial transport to which Britain
looks forward.

To begin with—and to get a long way, with as far as
that agett [—Chark Britain's behaviled assessment.

num norward. To bogin with—and to gn a long way, with as far os it goed!—Cheat Bricain's forchanded government aplated a Civil Aerial Transport Committee nearly two use sign—in May, 1917—with the sweiged object of

considering and reporting to the Air Board (since replaced by the Air Council) regarding the steps to be taken to mark the development and regulation after the war, of aviation, for purposes both civil and commercial, considered first from the domestic second from the national and finally from the international stand point and to agertain the extent to which it would be possible to use both trained personnel and existing aireraft which might be, at pen in excess of the requirements of the army and navy

In the language of the United States it was 'some committee, and it turned in some report Reference

report made some time ago. So far it has produced no report made some time ago so tal it has produced no result governmentally other than discussion and no ono in the Air Ministry ventures; it diction as to what the Cabinet is going to de with t. Cat on with the war has been so long at mee the 4 gain and the excussion for anything and everything over here that now that there is no war to get on with and a peace discussion which seems fairly likely to take the governments best attention for some time the government is a bit loathe to jump right into anything as big as a civil scrial transport scheme even though a hard working committee has drafted out the whole plan ready for action

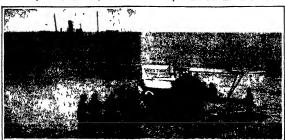

But the report and the discussion of it have had one very far reaching effect-they have turned many minds to the question and much soler thinking and carnest discussion have taken place Also the industry itself which was suddenly, like a bolt cut of the blue faced with dire consequences on November 11th his had a hance to look bround and make plans and consider the possibility of continuing or changing itself, with the changing itself, with the feeling of anxiety and less of pame even among airplane workers

I rom the discussion and the thought as one catches it here and there in talks with this governmental official and that secretary, that clerk and this sirplane constructor, this minister and that technical man, come two clear cut ideas. First under must Britam - minense industry, as created by the war, be second equally impossible is it to force a growth of ivil actial transport merely because one has factories and planes and aviators a most homely comparison. we had roads and horses and we had rouds and horses and wagons and mon for years before we had rural free delivery. When we got it, we got it little by little, bit by bit and made a success of it. So must it be with any well rounded scheme of civil serial transport—it must grow as fast as the public

If the two ideas seem incompatable one comes readily to the third which is gripping every out a attention here government interference, government in control government monouply government participation government subsidy of civil aerud tiansport Some say one and some say another, but nearly every one, in the Air Ministry and out of it, in the trade and out of it,

seem to think that only by some sort of government aid can the big industry be kept alive with the war stimulus removed, until the peace demand grows up to the capacity of the industry

This seems reasonable though Unquestionably, the industry is going to be allowed to exercise to its follost capacity the natural shrinkage which it will admit capacity the natural saturakage which it will admit voluntarily For instance there are many plants which are conversions—which were automobile factories or sewing machine plants or button futories, or furniture factories, which turned their facilities to some part of airplane making, when it was realized, two years ago, that (Continued on page 270)

Scapiane accidents such as this one are rure. Indeed, it is generally held that the scapiane is best adapted to civilian flying

These forty men and women were recently carried aloft by a British Handey-Page bombing plane, indicating its peace-time possibilities

is not made to the distinguished personnel, although such names as Northoliffs and H G Wells ring familiarly upon American ears It was a great committee because it did a great nicee of work

It divided itself into five broad divisions, and rendered It divided Red like has been divisions, and rendered at least one, and offerer more than one report on each of these subjects. OVER the hill of traction progress has come the massive Kelly-Springfield Caterpillar Tire for Trucks—the greatest advance in solid tire construction since the beginning of the industry.

Its elephant-footed sureness and lasting economy have immediately appealed to the heaviest truck users in the world. By a series of side air pockets—a new construction fully patented—it gives maximum traction, road contact and resiliency, with minimum vibration and vehicle depreciation.

The pockets permit the rubber to flow under load, take up the traction wave, reduce internal tire strain, and keep the tire cooler at all times.

As a new force in world industry, the Kelly-Springfield Caterpillar Tire has taken its place among the mighty

Kelly-Springfield Tire Company

This department is devoted to the interests of present and prospective owners of motor trucks and delivery wagons. The editor will endeavor to answer question relating to mechanical features, operation and monagement of commercial motor relactive.

#### Condenser for the Cooling System WHEN a truck does hard work VV especially on low gear the water in the cooling system tends t heat up toil

and steam and consequently consider ably water may be better a satisfing extra trouble and memory in C in filling up. In summer this kind of trouble is aggravated by the hot weather and in writer when easily evaporated un-freezing solutions are used the loss may entail const l rall pense in addition to the trouble and delay

An I astern manufacturer of ters means for eliminating or at least minimizing such froub les in a ministure condenser which is placed on top of the ordinary radiator cap the forced to pass upward through a provided with flanges to increase the radiation of heat as the tubes and flanges are exposed to the currents of air the coshing to the currents of air the cooling effect actually is considerable life vapor is condensed and drips back into the radiator in stead of being disappited in the air and altogether lost. In ad-A miniature condenser to dition to the model illustrated, which is intended for large trucks radiators are made for small tracks and for passenger cars In the latter ease the cooling element is simply a coil of plan thin-walled copper tubing

#### Easily Loaded Low-Hung Trailer

L OADING and unloading heavy ma ternal often is difficult and wasteful of time when it has to be handled to and from the platform of a truck or trailer of ordinary height and time is more; An appreciable saving is effected when the height is materially reduced. A manufacturer in the Middle West who makes a specialty of trailers has brought out a semi-trailer with the loading platform dropped well below the level of the for ward part which rests upon the rear end truck or tractor with the usual turntable coupling arrangement

The semi-trailer is of 5 time capacity and is designed for use with a truck or tractor of 1 2 or 2 tons nominal capacity there is a clear loading space of 16 feet at the low level, and the platform is but 34 inches from the ground. The trailer illustrated is equipped with a set of lever operated rollers by means of which a load of lumber can be dumped intact and left on the ground in a fairly neat pile For this particular work there is the further advantage that the short distance of th drop is less destructive to lumber than a longer drop. The work of dumping is made as easy as possible by fitting the rollers with roller bearings. The saint concern builds trailers to carry up to 10

#### Good Roads and Gasoline Rills

OME time ago we carried an account of tests made in California to determine the tractive effort required by arrous kinds of road surface and we illustrated these findings by means of a chart showing the number of horses that would be necessary to haul a given load over the various roads involved This was all very well, so far as it went but it did not lay a great deal of em-

the Missoure Highways Transport ( omnuttee has just given out a series of good roads pr tures and diagrams, one of which translates the California tests so admirably into terms of dollars and cents that we are impelled to add it to

The state of

load It is assumed that the automo-bile loaded, weighs two tons, and that in delivering one horse-power per hour to the drivers the engine consumes I 2 pints of gasoline per hour. The gasoline con-sumption for the different surfaces then

vibration of motor truck service, remains valutation of instor truthe service, remains and often causes trouble. One radiator manufacturer has succeeded in making a radiator in which 50 per cent of the joints are eliminated altogether, along with 50 per cent of the possibility of joint trouble

There must be some joints, and those are made by a process which brings the parts together under such heavy pressure that they are very strong and well adapted to resist vibration. A adapted to resist vibration. A material reduction in weight has also been brought about by careful designing and distribution of inetal, without making the radiator less substantial than former models

#### Using the Truck as a Tractor on the Farm

COLORADO farmer has A COLORADO farmer nee found a new use for his motor truck. He has been in the habit of using a big tractor to haul two wheat drills, and was shle to put in 30 acres of wheat in a working day A motor truck was used to carry seed grain to the drills because there was no way of carrying it on the tractor The expedient was tried of putting the wheat on the field shead of the tractor, to be

note ahead of the tractor, to be picked up in the course of the work, but this did not work well, largely for the reason that cattle found the grain and devoured it

grain and devoured it
So the farmer tried the experiment of
using the truck instead of the tractor to
pull the drill, at the same time carrying
the seed wheat along with it, and the
result surprised him According to his own statement, he covered just as much ground with the truck and one drill as he ground with the truck and one grin as ne and with the truck and one grin as ne did with the tractor and one drill for other work and eliminating a good deal of trouble besides. It was also found that the truck packed the soil less than the tractor would see in that the truck, following the suggestion thus brought forward, might well become an unportant feature of the farm machine equipment, doing in addition to what is ordinarily recognised as its own work, certain jobs that fall he-tween the province of the tractor and that of the horse or the unaided man

A low-hung trailer adapted to han! lumber at a great saving of time and money

statement of just what these types are will be found in our issue of January 5th,

in preparing this diagram, the Cali-fornia figures are taken for the pounds of tractive effort necessary per ton of

Using wing flows to widen the swath cleared by the snow plow

#### Clearing Roads of Snow

BREAKING out country roads after a heavy snowfall se by no means an easy task, nevertheless, it is something that must be done in view of the fact that road traffic has assumed greater materials than at any time in the past Motor trucks require good roads for their efficient operation, and the roads must be

kept in proper shape regardless of seasons.
The power of a big truck is more than aufficient to push an ordinary plow through ordinary snow, so wing plows often are added to mersuse the width of the swath cleared. The illustration shows a truck built by a well known middle western concern fitted with such wings, in addition to the ordinary plow wings, in addition to the ordinary plow at the front In order to clear telegraph poles, trees, fences, bridge railings, etc, as well as to allow vehicles to pass, the as well as to allow vehicles to pass, the wings are arranged to host to any desired angle. The crew of the snow-plowing truck consists of five men, the driver, a man to operate the front plow, a man for each wing plow and an entire helps. The truck can make a signific of from three to all or or even miles as four, according to the depth and the density of the snow.

"DESPITE running for 3 years and covering 40 000 miles, the original set of four Goodyear S-V Solid Tires are still doing good work on one of our 1-ton trucks They are economy tires "—Charles W London, for The Baltimore Chair & Furniture Company, Baltimore, Maryland

THE set of four Goodyear Solid Tires mentioned above cost \$149.70

Consequently, they have served at the astoundingly low figure of less than a tenth of a cent per tire-mile

In addition, this company reports that Goodyear Solid Tires on two other trucks are demonstrating the same kind of wearing qualities

Users of Goodyear Solid Fires frequently report mileages ranging from 20 000 up toward the sore reached in this case. Their economy is the firm basis of their widespread adoption.

"It is less costly to buy a good belt than to suffer from a poor one."

### Machines cannot make leather belting Machines are only tools requiring human guidance

If a thousand hides should be photographed like the one above, no two would be exactly alike, either for size or thickness. And that is why it takes trained men to make unstandardized material into belting device to hasten the work of reclamation which shall be uniform and reliable.

# Jewell Belting

is made by men so experienced that their judgment of leather is second nature, with a skill in handling it which can come only from years of training. The best possible belting can result only from the best materials, perfectly processed, and fashioned by men of consummate skill. That is Jewell. There is a strength for every drive, and a form for every purpose.

ties he in more or less complete run, and it is generally accepted that the state of destruction is such that the existing structures must be rased to the ground bafore reconstruction can begin

The Cermans have done their work well The Cermans have done their work well and thatoughly from their standpoint. Their afternit to cripple France industrially for years to come has been carefully thought for years to come has been carefully thought and systematically wrought for instance factory structures of steel have been flendably collapsed by sawing through most of the supporting steel columns and then wreeking the remaining supports by means of small charges of explosive Buildings of brick and stone have been tumbled to earth by clock-work-operated mines Radroads have been destroyed by explosives leaving a mass of twisted stor and huge craters in place of smooth rails and a level roadbed. Nothing so aptly describes the condition of the northern mining districts of France in the region of Lans as the aftermath of an appalling cattle as the intermeter of an appaining earthquisk. The roads are lined with tumbled and twisted masses of loose brick and stone steel beam, corrugated iron machiner, parts broken glass—a vast junk yard which awaits the house wrecker d the junk man

Lyplosives huge cranes thousands upor thousands of railroad trains and motor oxy acctains torches and electric are cutters and other equipment and personnel will be gare in putting northern I rance one more in order. The cover illustration of this more which has been suggested by an actual photograph conveys some idea of and reconstruction Such Gordian knots as twisted steel framework will be out by means of the axy-acetylene flame

#### The Current Supplement

IN spite of the fact that short-range weather forecasting does not always meet with unqualified success, the weather man is ever on the alert for some means which will give him the ability to make long range predictions and the public is interested in this matter hardly less than the meteorologist One rich possibility peratures and movements which because of the incomparably greater specific heat of the water than of the air, must exercise a wide influence upon atmospheric condi-tions. How do surface water temper-ature changes originate and move? How do these ocean temperatures control atmospheric pressure and winds? What weather occurs with winds that accompany a given pressure condition. These are questions which are asked and in part answered in an article Ocean Temperatures in Long Range Forecasting in the current move of the Scientific American Supplie-MENT No 2254 for March 15th The drops an oyster is inferior to his American but neverth less there is a well brither but nevertheless there is a went organized cyster industry in parts of Europe particularly in Holland, and it is illustrated and described in Oyster Cultiva-tion in Holland. #### Industrial Democracy and Engineering (Continued from page 868)

democracy and what it can mean

does it strive to reach in its progress?

Obviously opinions on these points differ and we have plenty of extremets and differ and we have plenty of extremists and radicals. However, that is logical and, as a matter of fact, desirable for progress and correct development. Regardless of these differences, however, certain features are especially and persistently evident and, on the important phases, there is at least a similarity in the opinions of the conservative leaders of thought on this subject

A consideration of these main features might be apropos here, and the writer offers as a possible definition of the aims and ideals of an industrial democracy the following

-a condition in industry whe the various human factors, and especially the three main groups, the owners or capitalists representing money, the mancapitalists representing money, the man-agers or executives representing the leader-ship and brains, and the workers or producers representing braws and physical effort, each are assured correctly ap-portioned representation in the counsels and administration of the industries Second—a plan of organization under which each of these three groups can cor-rectly function in the utimest harmony

rectly function in the utmost harmony and cooperation, securing the maximum preduction

Third-an acceptance by all these groups of standard working conditions hours, practices, etc., to be followed in the industries

Fourth—an agreement as to the factors which are to be considered in adjusting the relationships of these three groups Fifth and last-a basis and standards

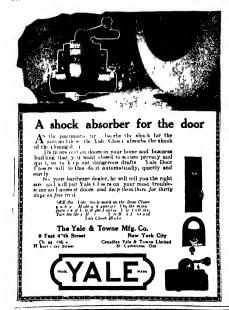

by which each group is fairly and equitably rewarded for all offort or interest, which also allows for sufficient incentive influence individual effort and progress While not dealing with all minor points

and details and probably without having brought forward any particularly new features, the writer believes these five features, the writer believes these five ideals as outlined give a composite of what is desired in industrial democracy as is desired in industrial democracy as generally advocated today Examining into these ideals and with some analysis we find the same two visions as mentioned before the chief basis. We find that bebefore the case of the way and that persides the two factors, capital and labor, a new one is interpolated, that of leadership Also, we find it each case an appreciation and realisation of the fact that labor a requirements and the individual worker's interest must be carefully and consistently provided for, not only as it has to do with financial reward but as well all other basic factors underlying our industrial system

And now, if we have established our arms

lactors underlying our industrial system
And now, if we have established our arguing ments that, regardless of whatever else
toomes in our plan of industrial democracy,
if there will be included a proper place for
leadership and control, and constrol, and
